Department of Health Confirms Plague in Rabbit from Santa Fe Urges Precautions to Protect Pets and their Owners

(Santa Fe) – The New Mexico Department of Health’s Scientific Laboratory confirmed plague in a rabbit from Santa Fe this week. The rabbit was found dead on a private residence about 1/2 mile north of the Santa Fe National Cemetery, 501 N. Guadalupe St. This is the first indication of plague activity in Santa Fe County this year. The Department has also investigated a case of plague in a dog near Ojo Caliente in Rio Arriba County in February.

In New Mexico, there was one human case of plague in 2008 in an Eddy County man who got the disease from hunting rabbits. There were five human plague cases with one fatality in 2007.

Plague, a bacterial disease of rodents, is generally transmitted to humans through the bites of infected fleas, but can also be transmitted by direct contact with infected animals, including rodents, rabbits, and pets.

“The Santa Fe area has had rabbits and rodents infected with plague in the past, so this is a good reminder to take precautions with your pets and your children,” said Dr. Paul Ettestad, the Department’s public health veterinarian. “Most pets infected with plague are hunters who have eaten an infected rodent or been bitten by their fleas prior to getting ill. The pets can also transport the fleas back into the home where they can infect people.”

Symptoms of plague in humans include sudden onset of fever, chills, headache, and weakness. In most cases there is a painful swelling of the lymph node in the groin, armpit or neck areas. Plague symptoms in cats and dogs are fever, lethargy, and loss of appetite. There may be a swelling in the lymph node under the jaw. With prompt diagnosis and appropriate antibiotic treatment, the fatality rate in people and pets can be greatly reduced.

To prevent plague:

- Avoid sick or dead rodents and rabbits, and their nests and burrows.
- Treat pets regularly with an effective flea control product, and prevent them from roaming and hunting.
- Clean up areas near the house where rodents could live, such as woodpiles, brush piles, junk and abandoned vehicles.
- Sick pets should be examined promptly by a veterinarian.
- See your doctor about any unexplained illness involving a sudden and severe fever.
