# Acknowledgments

We would like to thank the residents of New Mexico who participated in the 1999 Behavioral Risk Factor Surveillance System (BRFSS) survey. They gave their time and shared their experiences to help improve the health of all New Mexicans. This report would also not be possible without the tremendous work of the team of people who conducted the interviews:

Sylvia Abeyta  
Victoria Barr  
Catherine Bauer  
Amanda Chavez  
Sharon Cook  
Mary Dunham Day  
Clare Estrada  
Melissa Gonzales  
Rudy Gonzalez  
Hana Hanleigh  
Annie Hickman  
Margie Martinez  
Trudy Newell  
Tito Rios  
Erma Romero  
Jill Schwarz  
Roberta Smith  
Bill Stephens  
Liz Urioste  
Sandra Urioste  
Fernando Villa  
Nancy Vosika  
Kimberly Whelan

The 1999 BRFSS survey was funded by a cooperative agreement with the Centers for Disease Control and Prevention (Grant number U58/CCU603446-11), and through support from the Dental Health Program, the Diabetes Prevention and Control Program, the Chronic Disease Prevention and Control Bureau, the Disability and Health Program, the Family Health Bureau, the Office of Epidemiology, and the Border Health Office, District III, all of the Public Health Division of the New Mexico Department of Health.

Thanks to Isaac Romero for providing the map in Appendix II at the end of this report which defines the New Mexico Public Health Districts.

BRFSS data and copies of this report and the 1999 questionnaire are available from: Wayne A. Honey (505) 476-3569 ([wayneh@doh.state.nm.us](mailto:wayneh@doh.state.nm.us))

# What is the BRFSS?

Chronic disease, injury, substance abuse, and preventable infectious disease are the leading causes of morbidity and mortality in the U.S. The Behavioral Risk Factor Surveillance System (BRFSS) is an ongoing, nationwide surveillance system that collects data on the prevalence of health conditions in the population and behaviors that affect risk for disease. The surveillance system uses a telephone survey to collect data in all 50 states, the District of Columbia, Guam, Puerto Rico and the U.S. Virgin Islands. Individuals who are 18 years of age and older, live in a private residential household, and have a telephone are eligible for the survey. Adults who live in group homes or in institutions, such as prisons, college dormitories, or nursing homes, or live in household without a telephone, are not eligible for the study.

The BRFSS was initiated in the early 1980s after significant evidence had accumulated that behaviors played a major role in the risk for premature morbidity and mortality. Previous to that time, periodic national surveys were conducted to evaluate health behaviors for the whole country, but data were not available at the state level. Because states were ultimately responsible for efforts to reduce health risk behaviors, state level data was deemed critical.

At about the same time, telephone surveys were emerging as an acceptable means of collecting prevalence data. These types of surveys were relatively easy for states and local agencies to administer. As a result of these concurrent developments, surveys were developed by the Centers for Disease Control and Prevention (CDC) to monitor state-level prevalence of the major behavioral risk factors associated with premature morbidity and mortality. Feasibility studies were conducted in the early 1980's, and the CDC established the BRFSS in 1984 with 15 states participating. New Mexico began participating in the BRFSS in 1986.

Participation in the survey is voluntary, and all data collected are confidential. The identity of the respondent is never known to the interviewer, and the last two digits of the phone number are never sent to the CDC. The CDC removes the remaining eight digits of the phone number from the data file after completing their quality assurance protocol.

The BRFSS is supported and coordinated by the Behavioral Surveillance Branch (BSB), Division of Adult and Community Health (DACH), National Center for Chronic Disease Prevention and Health Promotion (NCCDPHP) of the CDC.

The CDC has a web site dedicated to the BRFSS:

**<http://www.cdc.gov/brfss>**

Prevalence data from the U.S. BRFSS are available online at:

**<http://apps.nccd.cdc.gov/brfss/index.asp>**

This 1999 NM BRFSS report is available in .pdf format at the NM Department of Health web-site:

**<http://www.health.state.nm.us/>**

# 1999 BRFSS Survey Topics

Questions in the 1999 BRFSS survey address a variety of health topics. Relevant demographic information is also collected. General topics are listed below.

## **Core components (all states):**

- Health Status
- Health Care Access
- Hypertension
- Cholesterol
- Oral Health
- Skin Cancer
- Tobacco Use
- Alcohol Consumption
- Women's Health
- Immunization
- Colorectal Cancer Screening
- Injury Control
- HIV/AIDS

## **Demographics section:**

- Age
- Race/ethnicity
- Gender
- Marital Status
- Number of Children in Household
- Education
- Employment Status
- Household Income
- County of Residence
- Number of Residential Telephone Numbers
- Weight
- Height

## **Optional modules included:**

- Cardiovascular Disease
- Preventive Counseling
- Osteoporosis
- Fruits and Vegetables
- Exercise
- Diabetes

## **State-added questions included:**

- Disability
- Personal Care
- Children's Health Care Access
- Environmental Health

## Limitations of BRFSS Data

Households without telephones are not eligible to participate in the BRFSS survey. Data collected by the Bureau of the Census under contract with the Federal Communications Commission (FCC) indicate that unemployed persons and lower income households are less likely to have telephones. Consequently, the BRFSS sample is likely to include a greater proportion of higher income households and employed persons than the population of the state as a whole.

The BRFSS relies on adults to provide information on their own health behaviors and conditions. Respondents may be reluctant to report behaviors that are considered undesirable such as drinking and driving. Consequently, the prevalence of these behaviors may be underestimated by the survey. Respondents may also have trouble remembering details about past behaviors or may remember them incorrectly.

The completion rate [ =  $\frac{\text{number of completed interviews}}{\text{number of completed interviews} + \text{number of refused interviews}}$  ]

for the 1999 survey was 76%. If the 24% of adults who were selected, but refused to be interviewed, differ in a systematic way from those who complete the interview, this may lead to bias in the prevalence estimates.

Telephone interviews have a number of advantages over other sampling methods such as face-to-face interviews and self-administered questionnaires. The lower cost of telephone interviews makes it possible to include a larger number of adults in the survey than would be possible if a face-to-face survey were conducted. Self-administered questionnaires will be affected by the literacy of the selected respondents and may be completed by family members other than the one selected. Telephone surveys are also easier to monitor for quality assurance purposes than are face-to-face surveys

## Data Presentation

The data in this report are presented in either tabular or graphical form, and are the estimated population percentages of people with a particular condition, risk factor, or behavior. Like any estimate produced from population surveys, the estimates produced from the BRFSS survey are subject to error (see Appendix I - Sources of Error). Two different, but related, measures of error are used in the data presentation; the standard error (SE) and the 95% confidence interval. These errors are related in that the 95% confidence interval is equal to the population estimate  $\pm 1.96(\text{SE})$ . When using bar graphs, we follow the standard practice of including standard error bars. In the Tables, the populations estimates are presented along with an error term defining the 95% confidence interval bounds, such that the interval defined will include the true population percentage 95% of the time. By BRFSS convention, when the number of respondents was  $<50$ , we did not present the weighted percentage because such estimates are deemed unreliable.

In general, population estimates with smaller errors are more precise than population estimates with larger errors. Since sample size influences the magnitude of an estimate's error, sample size will also affect the precision of the estimate. This issue is particularly relevant to some of the comparisons in this report, such as comparisons by race/ethnicity, where the number of Native Americans and 'Others' sampled was so small, and resultant errors so large, that the estimates were inherently unreliable. Thus, discerning possible statistically significant differences between rates of conditions and risk factors in these smaller populations compared to the larger White non-Hispanic, and Hispanic populations was difficult.

With respect to certain conditions and risk factors, particularly those addressed by core BRFSS questions which are asked of respondents in each state, we compared estimates in New Mexico (NM) to estimates for the 5 states bordering New Mexico (Region = Arizona, Colorado, Utah, Oklahoma, and Texas) and to the U.S. as a whole (U.S. = all 50 states, D.C., and Puerto Rico). In the case of questions included in optional BRFSS modules, we compared New Mexico estimates to estimates obtained by pooling data from all the other states (Other States) that administered the question.

# Demographics of 1999 New Mexico Sample

Table 1. Demographic Characteristic	1999 BRFSS Data			2000 Census Data †
	Number in Sample *	Unweighted Percent (%) <sup>⌘</sup>	Weighted Percent (%) <sup>⌘</sup>

SE (HD IV)	589	16.9	16.7	14.6
Bernalillo County	1,065	30.6	29.6	31.7

\* Those who responded don't know/not sure or who refused to respond are excluded. Consequently, the sample sizes may not add to 3,488 across categories for some variables.

⌘ For a discussion of the reasons for using weighted estimates, see the Appendix I at the end of this report.

† Source: U.S. Bureau of the Census.

\*\* Other includes homemakers, students, retirees, and those who are unable to work.

‡ NA indicates that 2000 Censal data are not available for this category (≥18 years old).

§ For a list of the counties in each public health planning district, see Appendix II at the end of this document. For this analysis, data from Bernalillo County respondents were removed from District 1 and are presented separately.

# Summary - NM Health Risk Factors and Chronic Conditions

This table summarizes the estimated prevalence of various health conditions and behaviors among New Mexicans in 1999. NM rates were also compared to rates for the Region † and for the U.S. \*, and are presented as being either higher (■) lower (□), or similar (▒; no statistical difference) to the comparison populations.

Table 2. Risk Factor/ Condition	Weighted Percent (95% CI) <sup>x</sup>	Year 2000 Health Target †	NM rates vs.	
			Region	U.S.
General health status is fair or poor	16.9 (± 1.4)	NA <sup>1</sup>	Similar	Higher
No health care coverage (2 questions)	18.3 (± 1.6)	0%	Higher	Higher
No medical checkup in 5 years	12.3 (± 1.2)	NA	Similar	Higher
Missed doctor visit in past year because of cost	13.4 (± 1.4)	NA	Similar	Higher
No flu shot during past year (Age 65 and older)	31.2 (± 4.1)	<40%	Similar	Similar
No colorectal cancer screening (Age 50 and older)	56.9 (± 3.0)	<40%	Similar	Similar
Never had a mammogram (age 40 and older)	16.4 (± 2.4)	NA	Similar	Higher
No breast exam & mammogram in 2 yrs (age ≥ 50)	34.1 (± 4.0)	<40%	Similar	Higher
Never had a Pap smear	5.7 (± 1.4)	<5%	Similar	Similar
No Pap smear in 2 yrs	18.6 (± 2.4)	<15%	Similar	Higher
Previous heart attack	8.0 (± 1.6)	NA	NC <sup>2</sup>	Lower <sup>3</sup>
Previous stroke	4.2 (± 1.2)	NA	NC <sup>2</sup>	Similar <sup>3</sup>
Coronary heart disease	7.6 (± 1.6)	NA	NC <sup>2</sup>	Lower <sup>3</sup>
High blood pressure	20.9 (± 1.6)	NA	Similar	Lower
Never had cholesterol checked	32.8 (± 1.8)	<25%	Higher	Higher
High cholesterol	18.3 (± 1.4)	<20%	Lower	Lower
Not exercising to reduce cardiovascular disease	49.8 (± 1.9)	NA	NC <sup>2</sup>	Higher <sup>3</sup>
Not eating less fat or cholesterol to reduce CVD	40.0 (± 1.9)	<10%	NC <sup>2</sup>	Higher <sup>3</sup>
Diabetes	5.5 (± 0.9)	<2.5%	Similar	Similar
No visit to dentist or dental clinic in 2 yrs	25.6 (± 1.8)	NA	Higher	Higher
Current smoker	22.4 (± 1.6)	<15%	Similar	Similar
Binge drinker	14.9 (± 1.4)	NA	Similar	Similar
Chronic drinker	3.8 (± 0.8)	NA	Similar	Similar
Drink and drive	2.3 (± 0.6)	NA	Similar	Similar
Kids seldom or never wear bike helmets	44.5 (± 4.2)	<50%	Similar	Higher
Household with no smoke detectors	10.2 (± 1.2)	0%	Higher	Higher
Smoke detectors not tested in past year	23.9 (± 1.8)	NA	Higher	Higher
At medium or high risk of infection with HIV	7.6 (± 1.2)	NA	Similar	Similar
< 5 servings of fruits and vegetables per day	84.6 (± 1.4)	<50%	NC <sup>2</sup>	Similar <sup>4</sup>
No leisure-time physical activities	23.0 (± 1.6)	<15%	NC <sup>2</sup>	Lower <sup>5</sup>
No regular or sustained physical activities	73.5 (± 1.6)	<70%	NC <sup>2</sup>	Lower <sup>5</sup>
Overweight and obese (BMI ≥ 25.0)	55.1 (± 1.9)	<20%	Similar	Similar
Sunburn in past year	34.9 (± 1.8)	NA	Higher	Higher

<sup>x</sup> For a discussion of the reasons for using weighted estimates, see the Appendix I at the end of this report.

† Healthy People 2000. DHHS Publication Number (PHS) 91-5021, 1991.

‡ Region includes the 5 states that border on New Mexico, namely Arizona, Utah, Colorado, Oklahoma, and Texas.

\* U.S. : the 50 states, plus District of Columbia and Puerto Rico.

1 NA indicates that a national estimate or national target is not available for this category.

2 No comparison; one or more of the states in the Region were not asked this question.

3 Comparison is to the following other states: Alabama, Arizona, Georgia, Indiana, Iowa, Kentucky, Louisiana, Maine, Mississippi, Montana, New York, North Carolina, North Dakota, Ohio, Oklahoma, South Carolina, Texas, Virginia, and Wisconsin.

4 Comparison is to the following other states: Arizona, Illinois, Ohio, South Carolina, Utah, and Virginia.

5 Comparison is to the following other states: Georgia, Hawaii, Illinois, Michigan, Nebraska, Ohio, Oklahoma, Tennessee, Utah, and Virginia.

# Health Status

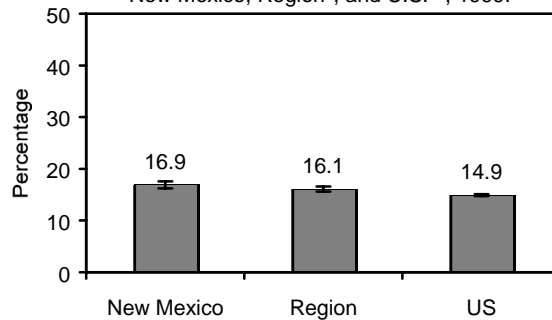

Question: "Would you say that in general your health is: excellent, very good, good, fair, or poor?"

The Centers for Disease Control and Prevention has defined health-related quality of life as "an individual's or group's perceived physical and mental health over time". This question is considered to be a reliable indicator of a person's general health and well being.

*In New Mexico,*

- ❖ *About 83.1% of New Mexicans reported that their general health was excellent, very good, or good. 16.9% of adults reported that their general health was fair or poor. This is higher than the percentage for the U.S. (14.9%) but not statistically different from the percentage for the Region (16.1%).*
- ❖ *New Mexicans with lower education or income were more likely to report fair or poor health status.*

Percentage of Adults Whose General Health Was Fair or Poor. New Mexico, Region\*, and U.S.\*\*, 1999.

\* Region: Arizona, Colorado, Utah, Oklahoma, and Texas.

\*\* 50 states, plus the District of Columbia and Puerto Rico.

# Satisfaction with Life

Question: "In general, how satisfied are you with your life?"

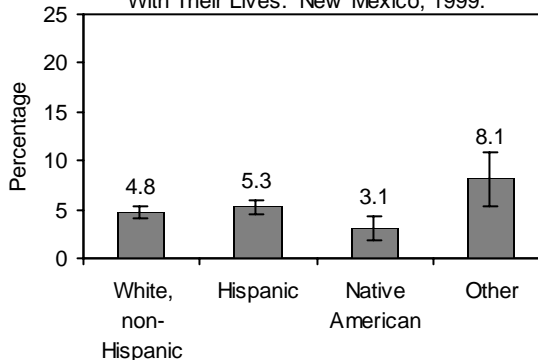

Answers: "Very satisfied", "Satisfied", "Dissatisfied", or "Very Dissatisfied".

This State-added question attempts to measure overall physical, mental, and spiritual well-being <sup>1</sup>.

In New Mexico,

- ❖ Only about 5% of adults reported that they are dissatisfied or very dissatisfied with their lives. The percentage was comparable across the various ethnic/racial groups.
- ❖ Low income, but not low education, was associated with dissatisfaction with life.
- ❖ The percentage of those dissatisfied with life was comparable across the different age groups.

# Social and Emotional Support

Question: "How often do you get the social and emotional support you need?"

Answers: "Always", "Usually", "Sometimes", "Rarely", or "Never"?"

Emotional and social support from others is an important aid in coping with life's challenges <sup>2</sup>.

In New Mexico,

- ❖ 8.8% of adults reported that they rarely or never get the social or emotional support they need.
- ❖ The percentages of Hispanics (10.8%), Native Americans (19.2%), and Others (12.8%) who rarely or never get the social or emotional support they need were higher than the percentage of White non-Hispanics (5.9%).
- ❖ The percentage of adults who rarely or never get the social and emotional support they need was highest in those with lower income or education.

For this analysis, Bernalillo County respondents were removed from District 1 and are presented separately.

\*\* Other includes homemakers, students, retirees, and those who are unable to work.

# Disability

Question 1: "Are you limited in any way in **any activities** because of any impairment or health problem?"

Question 2: "Are you limited in the **kind or amount of work** you can do because of any impairment or health problem?"

Question 3: "Because of any impairment or health problem, do you have **any trouble learning, remembering, or concentrating?**"

Question 4: "If you use **special equipment** or help from others to get around, what type do you use?"

Question 5: "Because of any impairment or health problem, do you need the help of other persons with your personal care needs, such as eating, bathing, dressing, or getting around the house?"

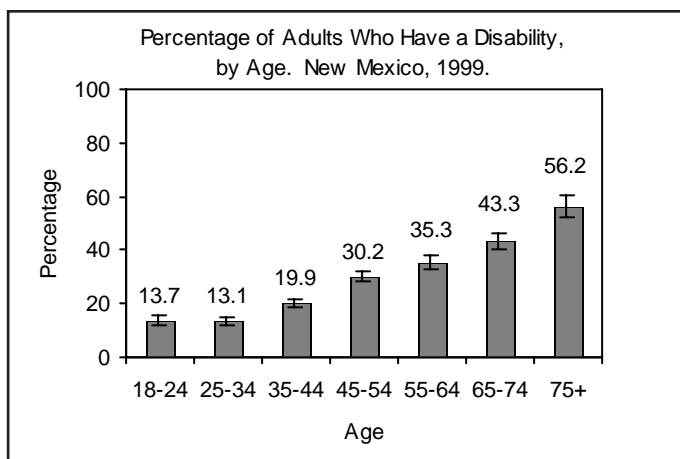

Question 6: "Because of any impairment or health problem, do you need the help of other persons in handling your routine needs, such as everyday household chores, doing necessary business, shopping, or getting around for other purposes?"

Research has shown that people with disabilities are at higher risk for developing additional disabilities or secondary conditions associated with their disability<sup>3,4</sup> and that many of these additional health conditions can be prevented. Health care costs for people with disabilities are four times higher than for those without disabilities<sup>5</sup>, and the social, employment, personal, family and community costs are difficult to measure.

Question 1-4 above, which address different types of physical and mental limitations, were used to define disability. Respondents answering "Yes" to any of the questions were categorized as having a disability. Questions 5 and 6 were used to group people with disabilities into two sub-groups<sup>6</sup> - those with disabilities not requiring assistance and those with disabilities requiring assistance.

*In New Mexico,*

- ❖ *An estimated 26% of adults had a disability and about 6.5% reported that they required assistance from others for their daily needs.*
- ❖ *Rates of disability increased with age.*
- ❖ *Females were nearly twice as likely to have disabilities requiring assistance as males. This increased risk in females occurred across all age groups and therefore is not related to the longer average lifespan of women.*

# Disability

\*\* Other includes homemakers, students, retirees, and those who are unable to work.

# Health Care Coverage

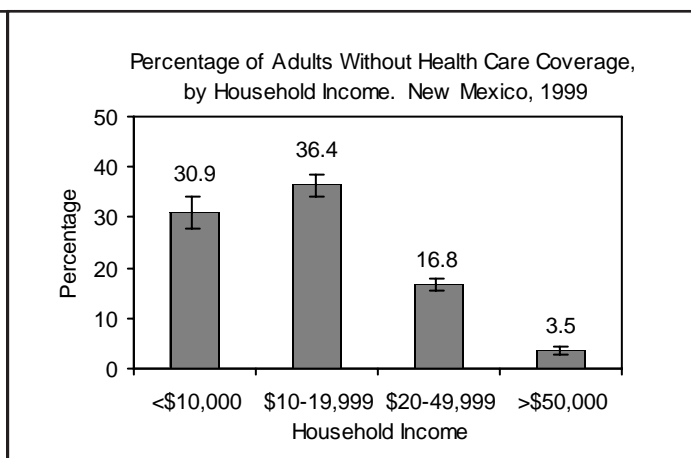

Question 1: "Do you have any kind of health care coverage, including health insurance, prepaid plans such as HMOs, or government plans such as Medicare?"

Question 2: "There are some types of coverage you may not have considered. Please tell me if you have any of the following? Coverage through: Your employer; someone else's employer; a plan that you or someone else buys on your own; Medicare; Medicaid or Medical Assistance; the military, CHAMPUS, or the VA; the Indian Health Service; or some other source."

Lack of health insurance coverage has been associated with increased mortality <sup>7</sup> and with delayed access to health care <sup>8</sup>. To better assess the full extent of health care coverage statewide, State-added question 2 above was also asked. The data presented here and in the following tables is based on responses to both questions.

In New Mexico,

- ❖ *The percentage of adults without health care coverage (18.3%) was higher than in either the Region (15.4%) or the U.S. (11.1%).*
- ❖ *Adults with no health care coverage were more likely to have lower education and income, and be unemployed.*
- ❖ *The percentage of adults with no health care coverage was highest among Hispanics (27.9%) and lowest among Native Americans (6.7%).*

# Health Care Access

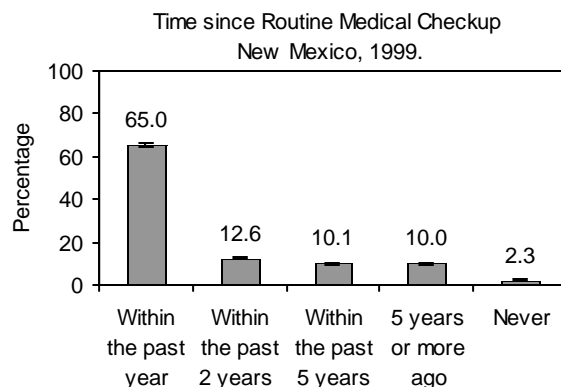

Question: "About how long has it been since you last visited a doctor for a routine checkup?"

Answers: "Within the past year", "Within the past two years", "Within the past 5 years", "5 or more years ago", or "Never".

A yearly medical checkup by a qualified health provider is recommended for good health maintenance.

In New Mexico,

- ❖ Nearly two out of three adults (65.0%) had a medical checkup within the past year. However, 12.3% of New Mexican adults had not had a checkup in 5 years. This was higher than the rate for the U.S. (9.5%) but not statistically different from the rate for the Region (10.9%).
- ❖ Males (17.2%) were more than twice as likely as females (7.7%) to have not had a medical checkup in the past 5 years.
- ❖ Those with lower education and income were more likely to have not had a medical checkup within the past 5 years.

# Health Care Access

Question: "Was there a time during the last 12 months when you needed to see a doctor but could not because of the cost?"

A person's ability and willingness to access health care is influenced by many factors, including cost.

In New Mexico,

- ❖ 13.4% of adults did not visit a doctor when they needed to within the past year because of cost. This was not statistically different from the percentage for the Region (13.1%) but higher than the percentage for the U.S. (10.3%).
- ❖ Rates of not visiting a doctor when needed because of cost were higher among those with lower education and lower incomes.
- ❖ Rates of not visiting a doctor when needed because of cost were about twice as high among Hispanics (18.7%) as they were among White non-Hispanics (10.0%), Native Americans (7.5%), and the Other group (9.4%)

# Influenza Immunization

Question: "During the past 12 months, have you had a flu shot?"

Two vaccine-preventable infectious diseases, influenza and pneumonia, in combination are the seventh leading cause of death in the U.S. and in the State of New Mexico <sup>9,10</sup>. Since most of these deaths are among the elderly, recommendations are that people 65 years of age and older receive a yearly influenza immunization as part of routine health maintenance. Other individuals at increased risk, such as those with chronic conditions like diabetes, also should be immunized. Data presented here are for adults age 65 and older.

In New Mexico,

- ❖ *31.2% of adults age 65 and older had not been immunized against influenza during the past 12 months. This rate was not statistically different from the rates for the Region (28.9%) and for the U.S. (33.4%).*
- ❖ *Rates of influenza immunization in people age 65 and older were higher among those with higher education and income.*
- ❖ *Rates of influenza immunization were much higher among adults (all ages) with diabetes than among those without diabetes. This may be due to increased awareness in this population of their heightened susceptibility to influenza.*

# Colorectal Cancer Screening

*Question: "A sigmoidoscopy or colonoscopy is when a tube is inserted in the rectum to view the bowel for signs of cancer and other health problems. Have you ever had this exam?"*

Colorectal cancer (which includes cancers of both the colon and rectum) is the second-leading cause of cancer-related deaths in the United States and in New Mexico <sup>11</sup>. Beginning at age 50, it is recommended that both men and women should have a yearly fecal occult blood test (FOBT), a flexible sigmoidoscopy every 5 years, and colonoscopy every 10 years.

*In New Mexico,*

- ❖ *56.9% of adults age 50 and older had never undergone sigmoidoscopy or colonoscopy. This rate was not statistically different from the rates for the Region (58.7%) or the U.S. (56.4%).*
- ❖ *Adults age 50 or over with lower education were less likely to have undergone sigmoidoscopy or colonoscopy.*
- ❖ *The percentage of adults age 50 and older who had undergone sigmoidoscopy or colonoscopy increased with age but never exceeded about 50% in any age group.*

Percentage of Adults Age 50 and Older Who Never Had a Sigmoidoscopy or Colonoscopy. New Mexico, Region\*, and U.S.\*\*, 1999.

# Women's Health

Question: "A mammogram is an X-ray of each breast to look for breast cancer. Have you ever had a mammogram?"

Question: "How long has it been since your last mammogram?"

Question: "A clinical breast exam is when a doctor, nurse, or other health professional feels the breast for lumps. Have you ever had a clinical breast exam?"

Question: "How long has it been since your last clinical breast exam?"

Percentage of Women Not Screened for Breast Cancer, New Mexico, Region\*, and U.S.\*\*, 1999.

\* Region: Arizona, Colorado, Utah, Oklahoma, and Texas.  
 \*\* 50 states, plus the District of Columbia and Puerto Rico.  
 Source: U.S. BRFSS, 1999.

Breast cancer is the second leading cause of cancer death among women in the U.S. and the most commonly diagnosed form of cancer <sup>12</sup>. Along with monthly breast self-exams, clinical breast exams and mammography are important tools for reducing mortality from breast cancer.

In New Mexico,

- ❖ 16.4% of women age 40 and older had never had a mammogram. This was higher than the percentage for the U.S. (13.1%) but not statistically different from the percentage for the Region (14.1%). Furthermore, 34.1% of women age 50 and older had not had a mammogram and a clinical breast exam in the previous two years. This was not statistically different from the percentage for the U.S. (30.6%) or the Region (33.0%).
- ❖ White non-Hispanic women had higher rates of breast cancer screening than Hispanic women (both criteria).
- ❖ Rates of never having had a mammogram in women age 40 and older decreased with education and income.
- ❖ Women in Bernalillo County were more likely than women in Health Districts I, III, IV to have had a mammogram and a breast exam within the past 2 years.

Percentage of Women Not Screened for Breast Cancer, by Race/Ethnicity. New Mexico, 1999

# Women's Health

Question: "A Pap smear is a test for cancer of the cervix. Have you ever had a Pap smear"

Question: "How long has it been since your last Pap smear?"

The human papillomavirus (HPV) is the major cause of cervical cancer in women <sup>13</sup>. HPV infections are sexually transmitted and both the risk of infection and cervical cancer risk increases with the number of sexual partners <sup>14</sup>. The Pap test, which detects cellular changes in the cervix indicative of HPV infection <sup>15</sup>, is used to identify women at higher risk for developing cervical cancer. Yearly Pap tests are recommended for all sexually-active women. Data presented are for women 18 and over.

In New Mexico,

- ❖ 5.7% of women had never had a Pap smear. This was lower than the percentage for the Region (7.5%) but not statistically different from the percentage for the U.S. (6.2%). Furthermore, 20.9% of women had not had a Pap smear in two years. This was higher than the percentage for the U.S. (18.5%) but not statistically different from the percentage for the Region (20.3%).

- ❖ Native Americans (12.4%) were more likely than White non-Hispanics (3.4%) to have never had a Pap smear.

- ❖ Cervical cancer screening rates were higher among those with higher education and income.

- ❖ Rates of not having had a Pap smear in 2 years were significantly higher in District IV than in any of the other Districts or Bernalillo County.

# Children's Health Care Access

Question: "How many children under 5 years old who live in your household have any kind of health coverage?"

Question: "How many children 5 through 12 years old who live in your household have any kind of health coverage?"

Question: "How many children 13 through 17 years old who live in your household have any kind of health coverage?"

These questions are state-added and are designed to determine whether children in New Mexico have some form of health care coverage.

In New Mexico,

- ❖ 11.4% of families with children under 18 did not have health insurance coverage for at least one of their children.
- ❖ Lack of health insurance coverage for at least one child under 18 in the household was more prevalent among Hispanics (14.7%) than among White non-Hispanics (8.6%) or Native Americans (4.6%).
- ❖ Lack of health insurance coverage for at least one child under 18 was more prevalent when parents had lower education or income.

# Preventive Counseling

Questions (4): "Has a doctor or other health professional ever: 1) talked to you about your diet or eating habits?" 2) talked to you about physical activity or exercise?" 3) talked to you about alcohol use?" 4) advised you to quit smoking?"

Answers: "Yes, within the past 12 months", "Yes, within the past 3 years", "Yes, 3 or more years ago", or "No".

Basic information about health risk factors and disease prevention is often provided by health care workers. These BRFSS questions assess the extent to which preventive practices such as weight control, exercise, smoking cessation, and moderation of alcohol intake, are being discussed by health care professionals. Although these questions were asked of all respondents, the data presented here are for at-risk subgroups who may be more likely to receive counseling. These groups include people who are overweight or obese (see pgs. 94-97), smokers (pgs. 69-71), and those at risk for acute and chronic drinking (see pgs. 72-77).

In New Mexico,

- ❖ Rates of having received preventive counseling in the past 3 years relating to various risk behaviors were consistently higher among women than men, except in the case of alcohol counseling where rates were not statistically different.
- ❖ Rates of having received preventive counseling in the past 3 years were highest among smokers counseled to quit smoking, with 51.5% of male smokers, and 67.4% of female smokers having been counseled to quit smoking.
- ❖ Rates of having been counseled in the past 3 years differed by Health District with respect to obesity/diet counseling, but were not statistically different among the Health Districts for the other risk behaviors.

# Preventive Counseling

❖ Those with higher education were more likely to have had preventive counseling than those with lower education, except with respect to alcohol consumption where rates were comparable across levels of education.

❖ Rates of preventive counseling were not statistically different among at-risk White non-Hispanics and Hispanics, except with respect to smoking cessation, where rates were higher among White non-Hispanics (68.7%) than among Hispanics (48.0%).

Bernalillo County	155	24.0	± 7.3

† Those who responded don't know/not sure or who refused to respond are excluded. Consequently, the sample sizes may not add to 3,488 across categories for some variables.

x<sup>†</sup> For a discussion of the reasons for using weighted estimates, see the Appendix I at the end of this report.

§ For a list of the counties in each public health planning district, see Appendix II at the end of this document.

For this analysis, Bernalillo County respondents were removed from District 1 and are presented separately.

\*\* Other includes homemakers, students, retirees, and those who are unable to work.

\* Estimates bases on cells with <50 respondents are considered unreliable.

# Cardiovascular Health - Heart Disease/Stroke

Question: "Have you ever been told by a doctor that you had any of the following:

- 1) heart attack or myocardial infarction,
- 2) angina or coronary heart disease,
- 3) stroke?"

The term 'Cardiovascular Disease' (CVD) encompasses a number of clinical conditions, including coronary heart disease (e.g. myocardial infarction or "heart attack" and angina pectoris), cerebrovascular disease or stroke, peripheral vascular disease, and congestive heart failure.

Heart disease was the number one cause of death in the U.S. and New Mexico in 1999 and stroke was the third leading cause in the U.S. and the fifth leading cause of death in New Mexico <sup>9,10</sup>.

In New Mexico,

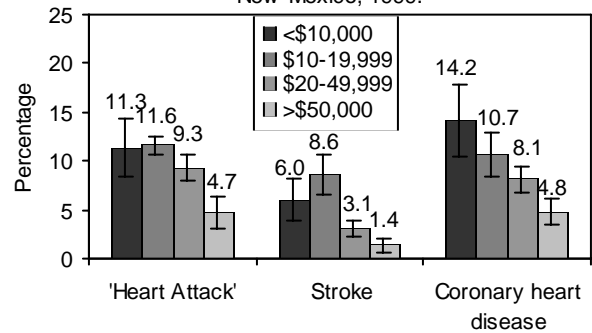

- ❖ Rates of heart attacks (8.0%) and coronary heart disease (7.6%) in adults age 50 and older were lower than rates in the Other States (9.8% and 9.5%) queried. Rates of stroke were statistically different (4.2% vs. 5.2%).
- ❖ Lower income was associated with higher rates of cardiovascular disease.
- ❖ The rates of heart attacks and coronary heart disease in New Mexicans age 50 and older were about twice as high among White non-Hispanics (9.5% and 9.5%, respectively) as they were among Hispanics (4.2% and 4.8%, respectively).
- ❖ Males age 50 and older were about twice as likely as females to have had a heart attack (11.3% vs. 5.3%) or have coronary heart disease (9.8% vs. 5.9%). Rates of stroke were not statistically different.

Percentage of Adults Age 50 and Older with Cardiovascular Disease. New Mexico, Other States\*, 1999.

Percentage of Adults Age 50 and Older with Cardiovascular Disease, by Race/Ethnicity. New Mexico, 1999.

Percentage of Adults Age 50 Years and Older with Cardiovascular Disease, by Sex. New Mexico, 1999.

# Cardiovascular Health - Heart Disease/Stroke

- ❖ *Rates of cardiovascular disease in adults age 50 and older with a smoking history were about twice as high as rates in those with no smoking history.*
  
- ❖ *Rates of cardiovascular disease in diabetics age 40 and older were more than twice as high as those in non-diabetics age 40 and older.*

Percentage of Adults Age 50 and Older with Cardiovascular Disease, by Smoking History. New Mexico, 1999.

Percentage of Adults Age 40 and Older with Cardiovascular Disease, by Diabetes status. New Mexico, 1999.

# Cardiovascular Health - Hypertension

Question: "Have you ever been told by a doctor, nurse, or other health professional that you have high blood pressure?"

Hypertension, or high blood pressure, is the leading cause of stroke and a major cause of heart attacks or myocardial infarctions <sup>16</sup>. Risk factors for hypertension include family history, diabetes, race (African-Americans have high risk), older age, being overweight, inactivity, smoking, and diet high in fat or sodium.

In New Mexico,

- ❖ 20.9% of adults had hypertension. This was not statistically different from rates for the Region (22.1%) but lower than rates for the U.S. (24.4%).
- ❖ Rates of hypertension were higher among those with lower education and income.
- ❖ Rates of hypertension were higher among those who were overweight or obese.

# Cardiovascular Health - Cholesterol

Question: "Have you ever had your blood cholesterol checked?"

Question: "Have you ever been told you have high blood cholesterol?"

High blood cholesterol is an important risk factor for cardiovascular disease <sup>17</sup>. Cholesterol screening is recommended for men ages 35-65 and women 45-65. Cholesterol is a fatty substance that is transported through the blood complexed to specialized carrier proteins. These lipoprotein complexes occur in either low-density (LDL) or high-density (HDL) forms. High serum levels of LDLs (so-called "bad cholesterol") increase risk for cardiovascular disease, whereas high levels of HDLs ("good cholesterol") reduce risk.

In New Mexico,

- ❖ The percentage of adults who had never had their blood cholesterol checked (32.8%) was higher than the percentage for the Region (26.8%) or for the U.S. (25.1%) .
- ❖ The percentage of adults who had never had their blood cholesterol checked was higher in Hispanics (43.4%) and Native Americans (42.8%) than it was in either White non-Hispanics (24.0%) or the 'Other' population (24.3%) .
- ❖ The percentage of New Mexicans with high blood cholesterol (18.3%) was lower than the percentage for the Region (20.7%) or the U.S. (22.5%).
- ❖ The percentage of adults with high blood cholesterol increased dramatically with age.

# Cardiovascular Health - Risk Reduction

Question: "To lower your risk of developing heart disease or stroke, are you exercising more?"

Question: "To lower your risk of developing heart disease or stroke, are you eating fewer high fat or high cholesterol foods?"

Poor eating habits, particularly consumption of foods high in fat, and lack of exercise are important risk factors for cardiovascular disease (CVD). These questions address whether respondents were modifying these behaviors in an effort to reduce cardiovascular disease risk.

In New Mexico,

- ❖ About half of the adult population (50.2%) was exercising more to reduce the risk of CVD. This was lower than the percentage for the Other States (61.5%). 60% of adults were eating less fat or cholesterol to reduce their risk of CVD. This percentage was lower than the percentage for the Other States (64.4%).
- ❖ Adults with higher household income were more likely to be exercising more and eating less dietary fat or cholesterol in order to reduce their risk of CVD.
- ❖ Adults with CVD were more likely to be exercising more (57.0%) or eating less dietary fat or cholesterol (74.6%) to reduce their risk of CVD than those with out CVD (49.7%,58.9%).

\*\* Other includes homemakers, students, retirees, and those who are unable to work.

# Diabetes

Question: "Have you ever been told by a doctor that you have diabetes?"

Diabetes is a chronic metabolic disease that was the sixth leading cause of death in both the U.S. and the state of New Mexico in 1999<sup>9,10</sup>. Diabetes takes two forms: Type 1, when the pancreas stops producing insulin, and Type 2, when cells no longer respond to insulin. The latter form, which accounts for the majority of cases, runs in families and is more common in those who don't exercise or are overweight. People with diabetes are at increased risk of a number of health problems, including cardiovascular disease, end-stage renal disease, and blindness.

In New Mexico,

- ❖ *The percentage of adults with diabetes was 5.5%. This was not statistically different from the percentage with diabetes in the Region (5.5%) or the U.S. (5.9%).*
  
- ❖ *The percentage of adults with diabetes was higher in the Native American population (16.2%) than in the other racial/ethnic groups.*
  
- ❖ *The prevalence of adults with diabetes correlated with weight status - obese individuals had the highest prevalence (10.4%), followed by overweight but not obese individuals (5.9%), followed by those who were not overweight or obese (2.7%).*
  
- ❖ *Adults with lower education and income were at higher risk of having diabetes.*

# Osteoporosis

Question: "Has a doctor ever told you that you have osteoporosis or weak bones?"

Question: "Have you ever fractured a bone as an adult?"

Osteoporosis<sup>18</sup>, or porous bone, is a disease characterized by low bone mass and structural deterioration of bone tissue, leading to bone fragility and an increased risk of fractures of the hip, rib, spine, and wrist. Osteoporosis, which increases with age, is a major public health threat for more than 28 million Americans, 80 percent of whom are women. Ways to reduce risk include: eating a balanced diet rich in calcium and vitamin D, weight bearing exercise, a healthy lifestyle with no smoking and limited alcohol intake, and bone density testing and medication when appropriate.

Since risk of osteoporosis increases with age, data are presented only for adults 55 years of age or older.

*In New Mexico,*

- ❖ *8.1% of adults 55 years of age and over had been diagnosed with osteoporosis. Rates were about 10 times higher in females (13.8%) than in males (1.2%).*
- ❖ *The prevalence of hip, wrist, rib, or spinal fractures (presumed osteoporosis) in adults over 55 years of age was higher among those with lower household income and education.*
- ❖ *Despite comparable rates of diagnosed osteoporosis among White non-Hispanics (8.9%) and Hispanics (7.4%), rates of fractures of the hip, wrist, rib, or spine were significantly higher among White non-Hispanics (14.6%) than among Hispanics (6.8%).*

# Oral Health

Question: "How long has it been since you last visited a dentist or dental clinic for any reason?"

Answer: "Within the past year", "Within the past 2 years", "Within the past 5 years", "5 or more years ago", "Never".

Regular dental visits are important in maintaining good oral health. In addition to care of the teeth and gums, dental visits are important in the early detection and treatment of oral diseases. Even people without teeth need to be monitored regularly for good oral health.

In New Mexico,

- ❖ *The percentage of adults who had not visited a dentist or dental clinic in 2 years was 25.6%. This was higher than the percentage for the U.S. (20.3%), but not statistically different from the percentage for the Region (23.9%).*
- ❖ *Individuals with lower education and household incomes were more likely to have not visited a dentist or dental clinic in the past 2 years.*
- ❖ *Men were more likely than women to have not visited a dentist or dental clinic in the past 2 years.*

Percentage of Adults Who Have Not Visited a Dentist or Dental Clinic in the Past 2 Years. New Mexico, Region\*, and U.S.\*\*, 1999.

\* Region: Arizona, Colorado, Utah, Oklahoma, and Texas.  
 \*\* 50 states, plus the District of Columbia and Puerto Rico.

# Tobacco Use

Question: "Have you smoked at least 100 cigarettes in your entire life?"

Question: "Do you smoke cigarettes every day, some days, or not at all?"

Smoking and chewing tobacco have been shown to be risk factors for lung, oral, bladder, kidney, and pancreatic cancer, as well as cardiovascular disease, particularly stroke <sup>19</sup>. BRFSS defines current smokers as respondents who answer "Yes" to the first question above, and "Every day" or "Some days" to the second question.

In New Mexico,

- ❖ The prevalence of smoking was 22.4%. This was not statistically different from the rates in the Region (21.9%) and the U.S. (22.5%).
- ❖ Native Americans (13.8%) had the lowest prevalence of smoking among the four racial/ethnic groups.
- ❖ The prevalence of smoking was highest among those with the lowest education and income.
- ❖ 9.0% of New Mexican smokers quit smoking during the past year. This was lower than smoking cessation rates in the Region (12.4%), but not statistically different from the rate in the U.S. (11.2%).

† Those who responded don't know/not sure or who refused to respond are excluded. Consequently, the sample sizes may not add to 3,488 across categories for some variables.

x<sup>7</sup> For a discussion of the reasons for using weighted estimates, see the Appendix I at the end of this report.

§ For a list of the counties in each public health planning district, see Appendix II at the end of this document.

For this analysis, Bernalillo County respondents were removed from District 1 and are presented separately.

\*\* Other includes homemakers, students, retirees, and those who are unable to work.

\* Estimates bases on cells with <50 respondents are considered unreliable.

# Alcohol Consumption

Question: "During the past month, have you had at least one drink of any alcoholic beverage such as beer, wine, wine coolers, or liquor?"

Question: "During the past month, how many days per week, or per month did you drink any alcoholic beverages, on the average?"

Question: "Considering all types of alcoholic beverages, how many times during the past month did you have 5 or more drinks on an occasion?"

Question: "During the past month, how many times have you driven when you've had perhaps too much to drink?"

Alcohol is a contributing factor in morbidity and mortality from other causes. For example, in 1999, alcohol was a factor in 38% of motor vehicle fatalities nationwide and nearly 45% of those in New Mexico <sup>20</sup>. In addition, alcohol is a risk factor for cirrhosis of the liver and for cancers of the oral cavity, larynx, and pharynx <sup>21</sup>. Binge drinkers are defined as those who had 5 or more drinks on at least one occasion during the past month; chronic drinkers had 60 or more drinks during the past month.

*In New Mexico,*

- ❖ *14.9% of adults were classified as binge drinkers. This rate was not statistically different from the rate in the Region (14.8%) and the U.S. (14.7%). 3.8% were classified as chronic drinkers. This rate also was not statistically different from the rates for both the Region (4.2%) and the U.S. (3.7%). The percentage of those who drink and drive (2.3%) was also not statistically different from the Region (2.6%) and U.S. (2.4%) rates.*
- ❖ *The percentage of respondents who were classified as binge drinkers was highest among young adults and declined with age.*
- ❖ *The percentage of respondents who were binge drinkers, chronic drinkers, or who drink and drive was much higher in males than in females.*

\* Region: Arizona, Colorado, Utah, Oklahoma, and Texas.  
\*\* 50 states, plus the District of Columbia and Puerto Rico.  
Source: U.S. BRFSS, 1999.

# Injury Control - Bike Helmets

Question: "During the past year, how often did your child wear a bicycle helmet when riding a bicycle?"

Every year, about 300 children are killed and another 400,000 go to hospital emergency rooms due to bicycle injuries <sup>22</sup>. Children between five and 14 have the highest injury rate of all bicycle riders, and bicycle injuries are one of the leading causes of injury deaths in this age group <sup>22</sup>. The most serious injuries can be prevented by wearing a bicycle helmet, which can reduce the likelihood of head injury by up to 85 percent <sup>22</sup>. Seventeen states and the District of Columbia have helmet laws applying to young bicyclists (New Mexico is not one of these) <sup>23</sup>. Helmets are important for riders of all ages, especially because older bicyclists represent more than two-thirds of bicycle deaths <sup>23</sup>.

In New Mexico,

- ❖ 44.5% of households who have children 5-16 years of age said that their children seldom or never wore bicycle helmets when riding a bike. This percentage was higher than the U.S. percentage (34.7%) but not statistically different from the percentage for the Region (44.1%).
- ❖ Households with lower education and income were more likely to have children 5-16 years of age who seldom or never wore a bike helmet when riding a bike.

# Injury Control - Smoke Detectors

*Question: "When was the last time you or someone else deliberately tested all of the smoke detectors in your house?"*

*Answers: "Within the past month", "Within the past 6 months", "Within the past year", "One or more years ago", "Never", or "No smoke detectors in home".*

Each year in the United States, more than 400,000 residential fires account for approximately 3,600 deaths and 18,600 injuries <sup>24</sup>. Many fire victims die of inhalation of smoke and toxic gases, not because of burns. When properly installed and maintained, the home smoke detector is one of the best and least expensive ways to provide early warning when a fire begins and can reduce the risk of death by 40-50% <sup>25</sup>.

*In New Mexico,*

- ❖ *10.2% of adults said that they live in households with no smoke detectors. This percentage was higher than the percentage for the Region (8.0%) and the U.S. (5.6%).*
- ❖ *Of those with smoke detectors, 23.9% said that their smoke detectors had not been checked during the past year. This percentage was higher than the percentage for the Region (21.6%) and the U.S. (18.7%).*
- ❖ *The percentage of Native Americans (18.3%) and Hispanics (12.3%) who were living in households without smoke detectors (18.3%) was higher than the percentage of White non-Hispanics (8.1%) and Others (6.0%).*
- ❖ *Adults with lower education and income were more likely to live in households without smoke detectors.*

# HIV/AIDS

Question: "What are your chances of getting infected with HIV, the virus that causes AIDS?"

Answer: "High", "Medium", "Low", or "None".

In New Mexico, AIDS cases have been tracked since 1981. As of December 1999, about 1,890 AIDS cases have been reported in the state. Among the cases reported in New Mexico, the most prevalent risk factor category was men having sex with men, followed by injection drug use. This BRFSS question, posed to all adults less than 65 years of age, asked the respondent to rate his/her chance of becoming infected with HIV. This 'perceived risk' does not presume any understanding of HIV transmission on the part of the respondent.

In New Mexico,

- ❖ *7.6% of adults felt that they were at high or medium risk for becoming infected with HIV. This figure was not statistically different from the percentages with perceived risk in the Region (6.6%) and the U.S. (7.4%).*
- ❖ *The percentage of Hispanics who felt that they were at high to medium risk of HIV infection (10.8%) was about twice as high as the percentage of White non-Hispanics (4.9%).*
- ❖ *The percentage of people with high to medium perceived risk of becoming infected with HIV was higher in younger age groups.*
- ❖ *Adults with incomes in the \$10,000 to \$19,999 range had higher perceived risk of becoming infected with HIV than the other income groups.*

Percentage of Adults at High or Medium Perceived Risk of Becoming Infected with HIV. New Mexico, Region\*, and U.S.\*\*, 1999.

\* Region: Arizona, Colorado, Utah, Oklahoma, and Texas.  
 \*\* 50 states, plus the District of Columbia and Puerto Rico.

§ For a list of the counties in each public health planning district, see Appendix II at the end of this document.

For this analysis, Bernalillo County respondents were removed from District 1 and are presented separately.

\*\* Other includes homemakers, students, retirees, and those who are unable to work.

# HIV/AIDS

*Question: "If you had a teenager who was sexually active, would you encourage him or her to use a condom?"*

Sexual contact is a major mode of transmission of HIV, the virus that causes AIDS. Condom use is recommended as an effective means of reducing exposure to HIV. This BRFSS question gauges attitudes toward AIDS prevention for sexually-active teenagers. This question was posed to all adults less than 65 years of age.

*In New Mexico,*

- ❖ *10.6% of adults would not advise their sexually-active teenager to use a condom to prevent HIV infection. This was not statistically different from the percentage for the Region (9.9%) or the U.S. (10.6%).*
- ❖ *The percentages of adults who would not advise their sexually-active teenager to use a condom to prevent HIV infection was higher among older age groups than among younger age groups.*
- ❖ *Adults with lower household incomes were more likely to advise their sexually-active teenager to use a condom to prevent HIV infection than adults with higher household incomes.*
- ❖ *Males were less likely than females to be willing to advise a sexually-active teenager to use a condom to prevent HIV infection.*

# Fruit and Vegetables

Question: "How often do you drink fruit juices such as orange, grapefruit, or tomato?"

Question: "Not counting juice, how often do you eat fruit?"

Question: "Not counting carrots, potatoes, or salad, how many servings of vegetables do you usually eat?"

Populations consuming diets high in fruits and vegetables tend to have a lower cancer risk. Fruits, vegetables, and grains contain a number of nutrients, including carotenoids, vitamin A, and vitamin C <sup>26</sup>. The cancers for which there is evidence of a protective effect from fruit and vegetables include those of the lung, colon and rectum, breast, oral cavity, esophagus, stomach, pancreas, uterus, cervix, and ovary. Persons with low fruit and vegetable intake have about twice the risk of epithelial cancers of the respiratory and digestive tracts as those with high intake <sup>27</sup>. The National Cancer Institute recommends that adults should consume at least 5 servings of fruit and vegetables a day for good health.

In New Mexico,

- ❖ Only 15.4% of adults said that they consumed at least 5 servings of fruit and vegetables per day. This was not statistically different from the percentage of respondents in Other States (15.7%).
- ❖ Education and income had no impact on whether adults ate at least 5 servings of fruit and vegetables per day.
- ❖ Adults in older age groups were more likely than those in younger age groups to eat at least 5 servings of fruit and vegetables per day.

# Exercise

Question: "During the past month, did you participate in any physical activities or exercises such as running, calisthenics, golf, gardening, walking, or swimming?"

Question: "How many times per week or month did you take part in this activity during the past month?"

Question: "When you took part in this activity, for how many minutes or hours did you usually keep at it?"

Among the health benefits of regular physical activity <sup>28,29</sup> are: reduced risk of coronary heart disease, lower heart rate and blood pressure, reduced weight, lower serum triglyceride levels, increased "good" cholesterol, reduced risk of Type II diabetes mellitus, reduced risk of osteoporosis by increasing bone density, boosting of immune function, beneficial effect on clotting mechanisms and improved psychological well-being and quality of life.

Those who engaged in regular and sustained physical activity reported physical activity done for 30 minutes or more per session, five or more times per week, regardless of intensity.

In New Mexico,

- ❖ *About 23% of adults engaged in no leisure-time physical activities within the previous month. This was lower than the percentage in the Other States (29.2%) that asked this question.*
- ❖ *Hispanics (28.8%) were more likely than White non-Hispanics (19.0%) or Others (10.6%) to have been physically inactive during the previous month.*
- ❖ *Adults with lower income and education were more likely to have engaged in no leisure-time physical activities during the past month.*
- ❖ *26.5% of adults engaged in regular and sustained physical activities. This was higher than the percentage of adults engaging in such physical activities in Other States (20.6%).*

# Weight

Question: "About how much do you weigh without shoes?"

Question: "About how tall are you without shoes?"

Being overweight or obese are known risk factors for diabetes, heart disease and stroke, hypertension, gallbladder disease, osteoarthritis (degeneration of cartilage and bone of joints), sleep apnea and other breathing problems, and some forms of cancer (uterine, breast, colorectal, kidney, and gallbladder).

Body Mass Index (BMI) is the measurement of choice for many obesity researchers and other health professionals. BMI is a calculation based on height and weight and is not gender-specific.  $BMI = \text{weight in pounds} \times 704.5 / (\text{height in inches})^2$ . The BRFSS identifies overweight as a BMI of 25-29.9, and obesity as a BMI of 30 or greater.

In New Mexico,

- ❖ 37.4% of adults were overweight and an additional 17.7% were obese based upon body mass index (BMI). This rate of being overweight was not statistically different from the rates for the Region (36.4%) and the U.S. (36.7%). The rate for obesity (17.7%) was not statistically different from the rate for the Region (19.1%), but lower than the rate for the U.S. (19.4%).
- ❖ The rate of being overweight was higher in men (45.6%) than women (29.4%), whereas the rate of obesity was not statistically different in men (16.8%) and women (18.6%).
- ❖ The percentage of adults who are overweight or obese increased with age to the 55-64 year age group, then declined in older age groups.

# Skin Cancer

Question: "Have you had a sunburn within the last 12 months?"

Exposure of the skin to the sun's rays increases the risk of skin cancer. Reducing sun exposure is therefore highly recommended, either by covering skin, staying indoors, or applying skin lotions that block harmful UV rays.

*In New Mexico,*

- ❖ *The percentage of adults who had a sunburn in the past year was 34.9%. This percentage was higher than the percentages for the Region (31.6%) and the U.S. (31.6%).*
- ❖ *White non-Hispanics were more likely (41.3%) to have had a sunburn in the past year than any of the other racial/ethnic groups.*
- ❖ *New Mexicans with higher education and income were more likely to have had a sunburn in the past year than those with lower education and income.*
- ❖ *The risk of having had a sunburn during the past year was significantly higher in the younger age groups. Also, males (40.4%) were more likely than females (29.7%) to have had a sunburn during the past year.*

Percentage of Adults Who Have Had a Sunburn in the Past 12 months. New Mexico, Region\*, and U.S.\*\*, 1999.

\* Region: Arizona, Colorado, Utah, Oklahoma, and Texas.

\*\* 50 states, plus the District of Columbia and Puerto Rico.

# Environmental Health

Question: "Do you have electricity in your home?"

Question: "Is public sewer service connected to your home?"

Question: "How is water connected to your home?"

Question: "What is the main source for your drinking water?"

Question: "Do you have regular garbage pickup at your home?"

Question: "If not, how do you get rid of your garbage?"

The State of New Mexico is one of the least populated states in the U.S., with an estimated population density in 2000 of ~15 people/square mile. Nearly half of the approximately 1.8 million people in the state live in the three urban areas of Albuquerque, Santa Fe, and Las Cruces. This means that greater than 50% of the state's inhabitants live in smaller communities or remote areas. This set of questions was added to assess environmental health infrastructure and related practices in the State.

In New Mexico,

- ❖ 99.9% of households had electricity, 99.6% had sewage disposal, and 99.6% had direct water connection to their houses.
- ❖ Drinking water was obtained from a variety of sources, with public water (66.3%), bottled water (15.9%), onsite well (12.4%), offsite wells (2.7%), and supermarket water machines (2.0%) providing over 99% of drinking water needs.
- ❖ 17.7% of households reported that they did not have household garbage pickup.
- ❖ For those without garbage pickup, a variety of methods were used to dispose of garbage, including using a dump (58.5%) or collection station (25.1%), burning (6.6%), paying a hauler to carry it away (3.1%), and burying it (1.7%).

## Appendix I - Methods

The Behavioral Risk Factor Surveillance System (BRFSS) is conducted using a randomized telephone survey. One implication of this survey method is that individuals living in households without telephones are not represented in the survey results. More than 94% of U.S. households subscribed to telephone service in 1999. However, in New Mexico, phone coverage was estimated to be 88%<sup>30</sup>. Phone coverage varies considerably from county to county within the state. For example, an estimated 98% of households in Los Alamos County have phones compared with only 55% of households in McKinley County<sup>31,32</sup>.

Interviews were performed at PC workstations using Ci3 computer-aided telephone interviewing software provided by Sawtooth Software. Random telephone numbers were provided by Genesys Telecommunications Laboratories, Inc.

Calls are made during several time periods throughout the day, in order to maximize the chance of finding respondents at home. The calling periods for the BRFSS in 1999 were:

Daytime:	10-4 Monday-Friday	Evening:	4-9 Monday-Friday
Weekends:	10-4 Saturday , 1-6 Sunday		

Approximately 1/12 of the annual sample is surveyed each month to avoid bias in the results due to seasonal variation.

### Sample selection

Households were chosen at random from all households in the state with telephones, using a disproportionate stratified sampling (DSS) design. Respondents were randomly selected from all adults 18 and older living in the household. The final 1999 sample size was 3,488 adults.

Under DSS, telephone numbers are selected from two strata or lists. One stratum contains blocks of phone numbers with a high proportion of household phone numbers (the high-density stratum). The other stratum contains blocks of phone numbers with a low proportion of household phone numbers (the low-density stratum). Telephone numbers in the high-density stratum are then sampled at a higher rate than telephone numbers in the low-density stratum. As a consequence, during analysis, records from the low-density stratum receive more weight than records from the high-density stratum.

Blocks of 100 numbers with the same area code, prefix, and first two digits of the suffix (sets of 100 telephone numbers with the same first 8 digits) are used to divide phone numbers into the high- and low-density strata. These blocks of 100 phone numbers with the same first 8 digits are called hundred blocks. Lists of telephone numbers from published directories are used to determine the number of listed household numbers in each hundred block. Telephone numbers from hundred blocks that contain no listed household numbers (0 blocks) are assigned to the low-density stratum. Telephone numbers from hundred blocks that contain one or more listed household numbers (1+ blocks) are assigned to the high-density stratum. The reason for this assignment is that nationally one to two percent of telephone numbers in 0 blocks are household numbers while 50 to 55 percent of telephone numbers from 1+ blocks are household numbers. Consequently, sampling at a higher rate from the one plus block stratum results in a higher "hit rate", i.e. more of the telephone numbers are household numbers.

Once a residential household has been selected, a respondent is randomly selected from among all adults aged 18 and over living in the household. After the interview has been completed, the last two digits of the phone number are dropped from the record. The entire telephone number is dropped from the final database, to preserve the respondent's anonymity. Names, SSNs, and addresses are not included in the record.

# Appendix I - Methods

## Sources of Error

Like any estimates produced from population surveys, the estimates produced from the BRFSS are subject to error. The sources of error can be classified into two categories, sampling error and non-sampling error. The information presented below is abstracted from two sources, The BRFSS User's Guide <sup>33</sup>, and an article from the Journal of the American Statistical Association <sup>34</sup>.

Sampling error results because the estimates are based on a random sample of the population. Since only a subset of the population of interest responds to the questions, different samples will yield different estimates. However, as long as the sampling plan is followed correctly, because the estimates are based on a probability sample, the amount of sampling error in the estimates is known and is reflected in the standard errors and confidence intervals of the estimates.

The second type of error, non-sampling error, could occur even if a census was taken, that is, even if all members of the state's population were asked to complete the survey questionnaire. Non-sampling errors are not reflected in the standard errors of the estimates, and the magnitude of this error is difficult to quantify. Because of non-sampling error, the total error in the estimate is typically larger than the estimated standard errors shown in the report.

Some examples of sources of **non-sampling error** are:

1. **Telephone non-coverage** refers to the fact that persons who do not live in residential households with telephones are not represented in the estimates.
  - ❖ Persons living in hospitals, nursing homes, prisons, and college dormitories are excluded.
  - ❖ Rates of telephone non-coverage are higher for some subgroups within the population than for others, e.g. lower income households may be under-represented in the final estimates.
2. **Non-response** is the inability to obtain responses from all individuals selected to be in the sample.
  - ❖ Unit non-response occurs when a respondent cannot be reached or refuses to participate. It can also result from language/cultural barriers, hearing problems or other barriers to participation.
  - ❖ Item non-response refers to the situation where responses to individual questions are missing. This type of error occurs when a respondent refuses to answer a question or doesn't know or can't recall the answer, or the question gets inadvertently skipped in the interview.
3. **Measurement error** is error due to inaccurate responses.
  - ❖ Inaccurate answers may be given by respondents who misunderstand questions, have faulty memory, or deliberately give false answers. The accuracy of the responses may also be influenced by attitudes toward the interview, the interviewer's tone of voice, and the length of the interview.
  - ❖ Recording or data entry errors are another form of measurement error.

# Appendix I - Methods

## Quality assurance

While error in survey estimates cannot be avoided entirely, the Survey Unit goes to great lengths to reduce non-sampling error. Some examples of measures taken to reduce error include:

- ❖ Training the interviewers at hire, at the beginning of each new survey year, and at the beginning of each new month of the survey.
- ❖ Editing of all completed surveys with follow-up callbacks to the respondent to resolve discrepancies.
- ❖ Further editing during data entry if responses to questionnaires do not follow pre-programmed database skip patterns.
- ❖ Frequent, prompt feedback to interviewers.
- ❖ Editing of keyed data for extreme or invalid values by a software program at the end of each month, prior to submission of the data to the CDC.
- ❖ Verification callbacks.

- 10% of the respondents who completed the survey are called back every month and asked to complete a short verification survey. This short survey repeats a subset of the questions asked in the original questionnaire.

## Implications of Sampling Design for Estimating Prevalence of Risk Factors and Health Conditions in the Population

The estimated prevalence of a risk behavior for the state is actually a weighted percentage. The proportion of respondents in the sample who report engaging in the behavior is adjusted by a weighting factor to produce the prevalence estimate for the state population as a whole. There are several components to the weight used to adjust the sample proportion.

1. The sampling weight reflects the fact that adults within the population have different probabilities of being included in the sample, because:

- ❖ Households with phone numbers in the low-density stratum (described under sample selection above) have a lower probability of being selected than households with phone numbers in the high-density stratum.
- ❖ Households with more than one phone line have a greater chance of being selected.
- ❖ In households containing many adults, each adult has a smaller chance of being randomly selected to complete the survey.

## Appendix I - Methods

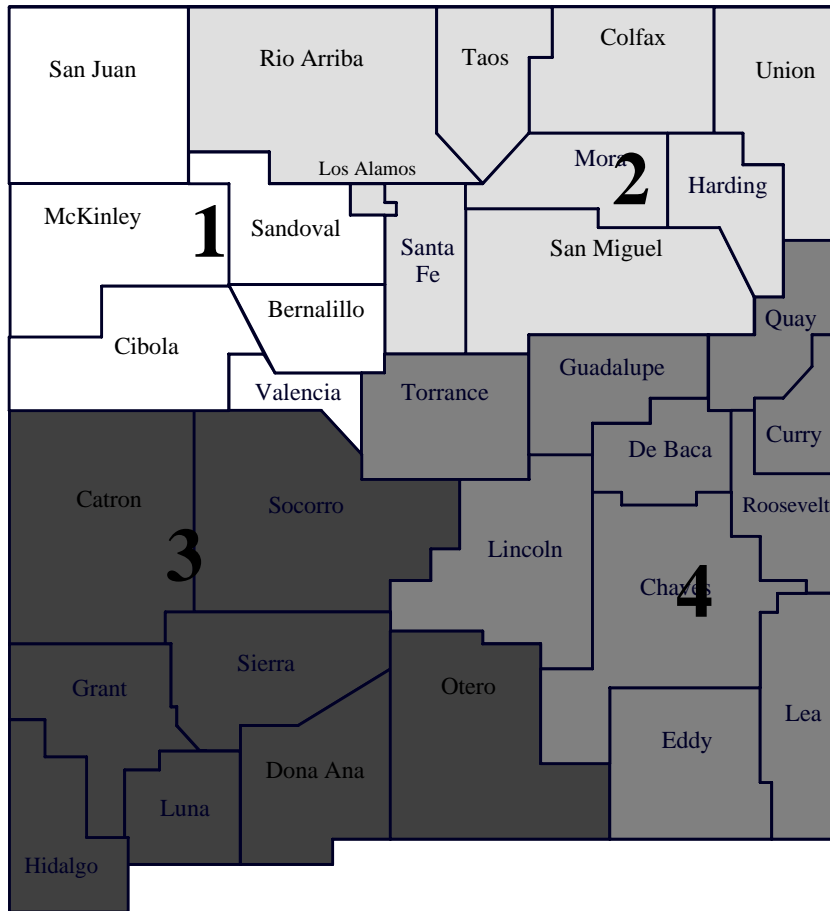

2. A post-stratification weighting procedure is used to adjust for differences in the distribution of the sample by gender and age group compared with the population, as determined by the Census. This component of the weighting process attempts to adjust the estimates so they better reflect the population of the state.

The final weight is the product of the sampling weight and the post-stratification weight.

STATA 7.0 software was used for all analyses in this report.
