For information about administration and methods used in implementation of the New Mexico Youth Risk and Resiliency Survey (NM YRRS), see the volume of statewide results, New Mexico Youth Risk & Resiliency Survey: High School Survey Results 2011, available at [www.youthrisk.org](http://www.youthrisk.org).

## ACKNOWLEDGEMENTS

This report is a product of the NM Youth Risk and Resiliency Survey (YRRS), a survey that aims to characterize risk behaviors and resiliency/protective factors among New Mexico youth. The YRRS is a joint project of the New Mexico Department of Health (NMDOH) and the New Mexico Public Education Department (PED), with support and technical assistance from the University of New Mexico Prevention Research Center (UNM PRC), AASTEC, and the Division of Adolescent and School Health, Centers for Disease Control and Prevention (CDC-DASH). Gratitude is extended to the individuals listed below for their contribution toward developing and producing this report. (Individuals who served on the NM-YRRS 2011 Steering Committee are identified by an asterisk (\*).)

Participation in Roosevelt County

The response rate for Roosevelt County was 51%.

A high response rate produces survey results that are more representative of the student population. A response rate of at least 60% allows generalization of results to the entire student body. A response rate of 70% is excellent and allows a high degree of confidence in results. Because a high response rate means that more students have been surveyed, a high response rate will also be reflected in the error bars (i.e., with a higher response rate and more students included in the survey, error bars will be smaller and confidence intervals will be narrower). Response rates below 60% are considered low, and caution should be exercised in interpreting results. Low response rates indicate that the data may represent only students who participated in the survey and not necessarily the entire student body.

Profile of students surveyed

Totals may add up to more or less than 100%, because

1. For race/ethnicity, respondents were allowed to choose multiple responses.
2. Data may be missing for some demographic measures if respondents chose not to answer certain questions.

New Mexico Youth Risk and Resiliency Survey (YRRS)  
Highlights  
Roosevelt County  
Grades 9-12, 2011

Highlights from the New Mexico Youth Risk and Resiliency Survey (YRRS)  
 Grades 9-12, 2011  
 Roosevelt County

Results from the 2011 High School NM YRRS revealed several encouraging trends in New Mexico. These include declining rates of:

- Suicide ideation and attempts
- Alcohol use
- Tobacco use
- Behaviors associated with violence

At the same time, the rates of cocaine and methamphetamine use have stabilized after declining from 2003 to 2007, the prevalence of obesity has been increasing, and the relatively new phenomenon of using a hookah (large water pipe) to smoke tobacco threatens the overall trend of declining tobacco use among youth.

This report puts the findings for New Mexico alongside YRRS results for Roosevelt County. Please use these results to help make New Mexico and your own community a safer and healthier place for all of our young people. For comprehensive YRRS results, see this website:

[www.youthrisk.org](http://www.youthrisk.org)

**Mental Health**

Suicide is the second leading cause of death among adolescents in New Mexico. Past-year suicide attempts have decreased among NM high school students from 14.3% in 2003 to 8.6% in 2011.

**Past Year Mental Health Indicators  
 NM & Roosevelt County  
 Grades 9-12, 2011**

\* Statistically significant difference

**Tobacco Use**

Cigarette smoking among NM high school students has been on the decline since 2003. In 2011, a new question was added to the YRRS about using a hookah, or large water pipe, to smoke tobacco. The prevalence of smoking a hookah was equal to that of current cigarette smoking.

**Current Cigarette and Hookah Use  
NM & Roosevelt County  
Grades 9-12, 2011**

\* Statistically significant difference

**Alcohol Use**

Alcohol use by young people is associated with injuries such as motor vehicle crashes, the leading cause of death among adolescents. Alcohol use at an early age is also associated with an increased risk of chronic liver disease and alcohol dependence later in life. In recent years, rates of current drinking, binge drinking, and drinking and driving have been decreasing among young people nationally and in New Mexico. While this is a hopeful sign for the future of New Mexico youth, in 2011 New Mexico high school students had the highest rate of any state participating in the CDC's Youth Risk Behavior Survey (YRBS) for drinking alcohol before the age of 13.

**Alcohol Use in the Past 30 Days  
 NM & Roosevelt County  
 Grades 9-12, 2011**

\* Statistically significant difference

**Drug Use**

Current cocaine and methamphetamine use declined among high school students from 2003 - 2007, and has since stabilized. There have been no other trends for current drug use in recent years.

**Current Drug Use  
NM & Roosevelt County  
Grades 9-12, 2011**

\* Statistically significant difference

**Sexual Activity**

Early and unsafe sexual activity puts teens at risk of unplanned pregnancy and sexually transmitted infections. Measures of sexual activity among NM high school students are similar to those of other states that participated in the YRBS. Very few sexually active\* teens used both condoms and reliable birth control.

**Sexual Activity  
 NM & Roosevelt County  
 Grades 9-12, 2011**

Sexually active: Had sexual intercourse at least once in the past three months.

\* Statistically significant difference

**Physical Activity, Nutrition, and Body Weight**

Poor nutritional behaviors and a lack of physical activity put young people at risk of becoming overweight or obese. Obesity and overweight place teens at risk of many chronic diseases that can cause death or disability. Obesity among New Mexico teens has been on the rise for several years.

**Obesity, Overweight, Physical Activity, and Soda Consumption  
NM & Roosevelt County  
Grades 9-12, 2011**

\* Statistically significant difference

**Behaviors Associated with Violence**

The rates for fighting, fighting on school property, and teen dating violence (physically hit, shoved, or pushed by a boyfriend or girlfriend in the past 12 months) have declined since 2003. In 2011, a new question was added to the YRRS about electronic bullying.

**Behaviors Associated with Violence, in the last 12 months**

## Appendix B About this Report

## Appendix B: About this Report

This report contains results from the 2011 New Mexico High School Youth Risk and Resiliency Survey (YRRS). The YRRS is a statewide survey of public school students in middle schools and high schools throughout New Mexico. Statewide and county level results are available at [www.YouthRisk.org](http://www.YouthRisk.org) and [www.health.state.nm.us/ERD/HealthData/yrrs.shtml](http://www.health.state.nm.us/ERD/HealthData/yrrs.shtml). In addition, school district reports have been prepared for each participating school district and have been distributed to school district offices. School districts are encouraged to reproduce and share these reports with community groups concerned with prevention and health promotion. School district level results will not be released without express permission of the school district superintendent. Forms for requesting school district data are available at [www.YouthRisk.org](http://www.YouthRisk.org). Together, these documents comprise a useful tool for those working on youth-related issues at the state and local level.

The YRRS is organized into two major content areas: risk behaviors and protective (resiliency) factors. Risk behaviors include behaviors associated with unintentional injury, violence, mental health, tobacco use, alcohol use, drug use, sexual activity, physical activity, and nutrition. Protective or resiliency factors are measures of the positive and supportive relationships, experiences, activities, resources and values that encourage healthy youth development. Resiliency factors and related traits include caring and supportive relationships in the family, school, community and with peers; boundaries set by the family and school; positive peer support; meaningful participation and constructive use of time in school and outside of school.

### Using the Report

The main section of this report consists of a module of results for each main topic area of the YRRS. The risk behavior modules each start with a set of line charts illustrating change in behavior over the years of the survey. The line charts are followed by one or more set of three bar charts. The first bar chart in each set compares the county prevalence of a group of behaviors to the NM prevalence for the same behaviors; the second compares the county prevalence for girls to that of boys for the same behaviors, and the third compares the county prevalence for each grade level.

Following the section on distinct risk and resiliency factors is a section that illustrates the relationship between risk behaviors and protective factors. This section consists of a set of bar charts, each showing the prevalence of a particular risk behavior for students with varying levels of selected protective factors.

In some cases when there were very few students in a particular age or gender group, data have been suppressed to protect the anonymity of the individual respondents. In these cases, charts showing prevalence by gender or grade level have been omitted from the report.

### Understanding the Charts - and A Word about Error Bars

The bar charts in this report present the percentage of students who reported engaging in any given risk behavior or who reported having any given protective factor. The height of the bars conveys the percentage of students reporting each trait, and provides a quick visual comparison between different groups of students reporting that trait. A label for each bar presents the actual percentage of students who reported each trait. For instance, the chart on page 25, Unintentional Injury, shows that 8.0% of students in New Mexico rarely or never wore seatbelts, while 6.6% of students in Roosevelt County rarely or never wore seatbelts.

Because of the high cost and logistical complications involved in conducting a statewide survey, the YRRS was administered to a sample of students, rather than to every single student in each school district. Because YRRS data are from a **sample** of students, and not the entire student body, the results in this report are **estimates**. As with all estimates, there is some uncertainty associated with each of these results. On the charts in this report, this degree of uncertainty is represented by an error bar (or confidence interval). The error bar is the thin 'I' shaped line that extends above and below the end of each bar in a chart. One of the major influences on the size of the confidence interval or error bar is the number of participants in the survey. In general, this means that with more students participating in the survey, there will be a higher degree of confidence in the results (i.e., error bars will be smaller).

The proper interpretation of an error bar can be illustrated by looking at the chart below. This chart compares the New Mexico prevalence of smoking and cocaine use to the United States prevalence for 2011. The chart shows that the prevalence of current smoking was 19.9% in New Mexico and 18.1% in the United States. The error bar for the estimate of current smoking among New Mexico students extends approximately 2 percentage points in either direction, from 17.6% to 22.4%. This means that we are confident that the actual percentage of smokers in this group of students was between 17.6% and 22.4%. The error bar for the estimate of current smoking in the US extends approximately 1.5 percentage points in either direction, from 16.7% to 19.5%. We are confident that the actual percentage of smokers among this group was between 16.7% and 19.5%.

How does knowing the upper and lower limits of our error bars help us? While it appears at first glance that New Mexico has a higher prevalence of smoking than the United States (19.9% vs. 18.1%), a closer look at the error bars shows a more complicated picture. The error bars for the New Mexico estimate (17.6%–22.4%) and the US estimate (16.7%–19.5%) overlap. Because of this overlap, we do not have a high degree of confidence that the prevalence of smoking in New Mexico is actually different from the prevalence in the United States. In other words, the difference between the prevalence of smoking in New Mexico and the United States is not statistically significant.

For cocaine use it also appears that New Mexico had a higher prevalence than the United States (5.2% vs. 3.0%). The error bar for New Mexico extends from 4.3% to 6.2%, and the error bar for the United States extends from 2.6% to 3.5%. Because the higher bound of the US error bar (3.5%) is lower than the lower bound of the NM error bar (4.3%), these error bars do not overlap. For cocaine use, we are confident in saying that the New Mexico prevalence was higher than the US prevalence. In other words, the difference between the prevalence of cocaine use in New Mexico and the United States was a statistically significant difference.

For some small school districts, error bars have been removed from this report. With small populations, the number of students sampled can approach the total student population. In these cases, error bars would have limited meaning because with a high percentage of students surveyed, there is less uncertainty around the estimates than error bars suggest.
