

### **Epidemiology and Response Division**

# NEW MEXICO INFLUENZA SURVEILLANCE UPDATE 2008-2009 Influenza Season

| Week Ending        | Activity Level |
|--------------------|----------------|
| 10/25/08 (MMWR 43) | No Activity    |

NMDOH reported the state influenza activity as "**No Activity**" to the Centers for Disease Control and Prevention (CDC) (see table on page 3 for definitions).

#### Summary of Influenza Surveillance in NM for Week Ending 10/25/08<sup>1</sup>:

Twenty-four of the 26 sentinel provider sites reporting:

- total of 7,275 patient visits seen for any reason,
- 53 (0.7%) were positive for influenza-like illness (ILI)<sup>2</sup>, and
- previous week (ending October 18<sup>th</sup>) reported 0.9 % influenza-like illness.

#### **Summary of Sentinel Laboratory Influenza Testing in NM:**

| <i>y</i>  | ,                                 |                             | •                           |  |                                      |
|---|-----------------------------------|-----------------------------|-----------------------------|--|--------------------------------------|
| Period of 2008-2009<br>Influenza Season           | Number of<br>Tests<br>Performed** | Positive<br>Type A<br>(n,%) | Positive<br>Type B<br>(n,%) | Positive<br>Type Unknown <sup>3</sup><br>(n,%) | Total Positive<br>All Types<br>(n,%) |
| Week ending 10/25/08<br>(27 of 32 labs reporting) | 126                               | 3 (2.4%)                    | 0 (0.0%)                    | 0 (0.0%)                                       | 3 (2.4%)                             |
| Cumulative as of 9/28/08                          | 392                               | 8 (2.0%)                    | 1 (0.3%)                    | 0 (0.0%)                                       | 9 (2.3%)                             |

<sup>\*\*</sup>Includes rapid antigen and immunofluorescence testing (i.e., direct fluorescent antibody staining)

Note: The sensitivity and specificity of point of care rapid diagnostic tests vary during times when influenza is not circulating widely. The NM Influenza Surveillance Program expects some false positive rapid diagnostic results outside the time of peak influenza activity (i.e., beginning and end of season). The first NM laboratory confirmed case of the influenza season is based on a positive viral culture result.

#### **Influenza-Related Pediatric Mortality:**

There were no cases of influenza-related pediatric deaths reported by any state to CDC for week ending 10/25/08. Last season, NM reported one pediatric influenza-related death.

#### Influenza Activity, Mountain Region and Bordering States, Week Ending 10/25/08:

| State      | Activity Level | State    | Activity Level |
|------------|----------------|----------|----------------|
| Montana    | None           | Arizona  | None           |
| Idaho      | Sporadic       | Utah     | Sporadic       |
| Wyoming    | Sporadic       | Nevada   | None           |
| Colorado   | None           | Texas    | Sporadic       |
| New Mexico | None           | Oklahoma | None           |

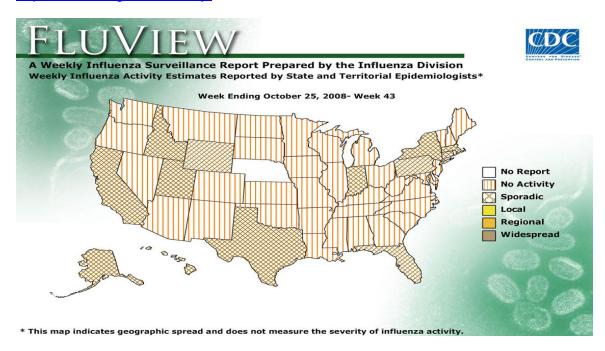

Weekly ILI and lab data may change as additional reports are compiled.

<sup>&</sup>lt;sup>2</sup> Influenza-like Activity (ILI) is defined as Fever (≥ 100°F [37.8° C], oral or equivalent) AND cough and/or sore throat in absence of a KNOWN cause other than influenza.

<sup>&</sup>lt;sup>3</sup> Some rapid influenza tests cannot differentiate between types A and B.

#### National Flu Surveillance and Laboratory Activity, Week Ending 10/25/08:

**Flu Activity:** Nationwide, for the week ending 10/25//08, 1.0% of patient visits to U.S. sentinel providers were due to ILI, which is below the national baseline of 2.4%. Refer to map below for state by state reported activity. More information on national surveillance can be found at: http://www.cdc.gov/flu/weekly/.

**Laboratory Activity**: During this same week, the World Health Organization (WHO) and National Respiratory and Enteric Virus Surveillance System (NREVSS) laboratories reported 1,251 specimens tested for influenza viruses, 5 of which were positive: 3 influenza A viruses that were not subtyped (Pacific and West South Central regions) and two influenza B (Pacific and South Atlantic regions).

## Recommended vaccine composition of influenza virus vaccines for use in the 2008-2009 influenza season:

- influenza A/Brisbane/59/2007-like virus (H1N1),
- influenza A/Brisbane/10/2007-like (H3N2), and
- influenza B/Florida/04/2006-like virus.

Information on available influenza vaccination clinics can be found at a website maintained by the New Mexico Influenza Vaccine Consortium:

http://www.nmmra.org/nmivc/cliniclist.php

This information is collected by the Influenza Sentinel Surveillance Program, Infectious Disease Epidemiology Bureau, Epidemiology Response Division, NMDOH. For questions, please call 505-827-0006.

#### **Table: Influenza Activity Levels**

| Activity Level                            | ILI activity*/Outbreaks  |     | Laboratory data   |  |
|---|--|-----|---|--|
| No activity                               | Low  | And | No lab confirmed cases <sup>†</sup>   |  |
|   | Not increased  | And | Isolated lab-confirmed cases  |  |
| Sporadic                                  | OR   |     |   |  |
|   | Not increased  | And | Lab confirmed outbreak in one institution <sup>‡</sup>  |  |
|   | Increased ILI in 1 region**;<br>ILI activity in other regions<br>is not increased  | And | Recent (within the past 3 weeks) lab evidence of influenza in region with increased ILI   |  |
| Local                                     | OR   |     |   |  |
| 2 or more outbreaks confirmed activity in | 2 or more institutional<br>outbreaks (ILI or lab<br>confirmed) in 1 region; ILI<br>activity in other regions is<br>not increased | And | Recent (within the past 3 weeks) lab<br>evidence of influenza in region with the<br>outbreaks; virus activity is no greater than<br>sporadic in other regions |  |
| Regional                                  | Increased ILI in ≥2 but less than half of the regions  | And | Recent (within the past 3 weeks) lab confirmed influenza in the affected regions  |  |
| (doesn't apply                            |  |     | OR  |  |
| to states with ≤4 regions)                | Institutional outbreaks (ILI or lab confirmed) in ≥2 and less than half of the regions   | And | Recent (within the past 3 weeks) lab confirmed influenza in the affected regions  |  |
| Widespread                                | Increased ILI and/or institutional outbreaks (ILI or lab confirmed) in at least half of the regions                              | And | Recent (within the past 3 weeks) lab confirmed influenza in the state.  |  |

<sup>\*</sup>Influenza-like illness: Fever (≥ 100°F [37.8°C], oral or equivalent) and cough and/or sore throat (in the absence of a known cause other than influenza)

<sup>&</sup>lt;sup>†</sup> Lab confirmed case = case confirmed by rapid diagnostic test, antigen detection, culture, or PCR. Care should be given when relying on results of point of care rapid diagnostic test kits during times when influenza is not circulating widely. The sensitivity and specificity of these tests vary and the predicative value positive may be low outside the time of peak influenza activity. Therefore, a state may wish to obtain laboratory confirmation of influenza by testing methods other than point of care rapid tests for reporting the first laboratory confirmed case of influenza of the season.

<sup>&</sup>lt;sup>‡</sup>Institution includes nursing home, hospital, prison, school, etc.

<sup>\*\*</sup>Region: population under surveillance in a defined geographical subdivision of a state. A region could be comprised of 1 or more counties and would be based on each state's specific circumstances. Depending on the size of the state, the number of regions could range from 2 to approximately 12. The definition of regions would be left to the state but existing state health districts could be used in many states. Allowing states to define regions would avoid somewhat arbitrary county lines and allow states to make divisions that make sense based on geographic population clusters. Focusing on regions larger than counties would also improve the likelihood that data needed for estimating activity would be available.
