Executive Summary

The NMDOH maintains the Hospital Inpatient Discharge Database (HIDD). This report is based on data generated from the HIDD. The hospital inpatient diagnoses contained in the database were coded using the International Classification of Diseases, Ninth Revision, Clinical Modification (ICD-9-CM). General and specialty hospitals in the state are annually required to report hospital inpatient discharge data to the NMDOH. Federal facilities are not required to report HIDD data to the NMDOH. Therefore, data from Indian Health Service (IHS) facilities and the Veterans Affairs (VA) Hospital are not included. However, the NMDOH is exploring ways to access IHS and VA Hospital data.

An inpatient discharge occurs when a patient is admitted overnight to a hospital and leaves that hospital. Thus, an individual who is transferred from hospital A to hospital B would be included in the discharges from hospital A with a second discharge from hospital B.

This report presents overall New Mexico hospital inpatient discharge numbers, rates, and average lengths of stay by age, Sex and region. In 2014, 37 general and 13 specialty hospitals reported hospital inpatient discharge data to the NMDOH. These 37 non-federal, general hospitals reported a total of 155,006 discharges for New Mexico State residents (data from specialty hospitals were not included in this report). Duplicate records and records with out-of-state or unknown zip codes, unknown age, unknown sex, unknown or invalid primary diagnosis codes and discharges that were not inpatient discharges were excluded from this count. Discharges of newborns were also excluded to be consistent with federal reporting standards.

Of the 155,006 reported discharges, approximately 60 percent were among females and 40 percent were among males. Thirty-five percent of all discharges occurred among residents over the age of 64 years. The highest discharge rate by region was 740.7 discharges per 10,000 population in the Southeast region, and the lowest rates were in the Northeast region (679.6 discharges per 10,000 population).

Methods

Although data is verified with the submitting hospital, all data and information presented in this report are as submitted by reporting hospitals to the NMDOH. The original data is the responsibility of the submitting hospital.

Several records were excluded from the data reported in this report. As indicated in the table below, duplicate records and records with out-of-state or unknown zip codes, unknown age, unknown sex, unknown or invalid primary diagnosis codes and discharges that were not inpatient discharges or discharges from specialty hospitals were excluded. Discharges of newborns were excluded to be consistent with federal reporting standards. At this time, specialty hospitals (rehabilitation and behavioral health facilities) are not included in this report due to an incomplete dataset for this reporting year or for previous years (impact on trend analysis). In the future, we plan to gather data from all available specialty hospitals to better represent mental health conditions in New Mexico.

Excluded Records 2014 HIDD	
Total Records Collected	196,195
Specialty Hospital Discharges	
Duplicates	
Unknown Age	
Unknown Sex	
Out-of-State of Unknown Zip Code	
Invalid Diagnosis Code (Primary Diagnosis=000.8)	
Unknown Primary Diagnosis	
Newborns	
Not an Inpatient Record	
Remaining Records Used in 2014 HIDD Reporting	155,006

New Mexico Hospital Inpatient Discharge Data: The New Mexico Health Information System (HIS) was established in 1989 pursuant to the Health Information System Act, Section 24-14A-1 through Section 24-14A-10 NMSA 1978. The NMDOH is charged with creating rules regarding the collection, use and reporting of these data (NMAC 7.1.27). The rule relates to several specific areas, including specific information to be reported by state licensed general and specialty hospitals, the data access policy and public reporting requirements.

All New Mexico general and specialty hospitals are required to report hospital inpatient discharge data to the NMDOH quarterly (not including federal hospitals). The NMDOH maintains the Hospital Inpatient Discharge Database (HIDD). The 2014 New Mexico data presented in this report was generated from the HIDD. The HIDD dataset is uploaded to NMDOH's public health information resource: NM-IBIS (<https://ibis.health.state.nm.us/>). The majority of the tables and graphs included in this report were generated from queries completed on this platform.

United States Hospital Inpatient Discharge Data: U.S. data used for comparison with New Mexico data were provided by the National Center for Health Statistics' National Health Statistics Reports. The report presents the most current nationally representative data on inpatient care, excluding newborns, in the U.S. Data are from the 2010 National Hospital Discharge Survey, the longest continuously running nationally representative survey of hospital utilization. This survey is a probability sample survey of non-federal hospitals.

State Population Estimates: State population estimates used for the denominator in hospitalization discharge rates were generated by the NM Population Estimates, Geospatial and Population Studies (GPS) Program, University of New Mexico (<http://gps.unm.edu/>). The GPS evaluates all input data and employs a housing unit-based methodology, validated by building permits and birth/death records. Population denominators 2014 were used. Rates were age-adjusted to the 2000 U.S. standard population, when indicated.

Ambulatory Care Sensitive Conditions: High rates of ambulatory care sensitive conditions (ACSC) are an indication of a lack of access to, availability of, or quality of primary care services. Quality of primary care services is illustrated by low rates of ACSC. ACSC are illnesses that can often be managed effectively on an outpatient basis and generally do not result in hospitalization if managed properly. These conditions include, but are not limited to bacterial pneumonia and congestive heart failure. These conditions commonly impact a large number of people and often result in unnecessary hospitalizations. This causes health care costs to increase, which could be avoided through quality primary care and early interventions.

The Agency of Healthcare Quality and Research's (AHRQ) Prevention Quality Indicators calculation methods were used for this analysis (http://www.qualityindicators.ahrq.gov/Modules/PQI_TechSpec.aspx). The New Mexico Hospital Inpatient Discharge Database (NM-HIDD) for 2014 was used to calculate age-adjusted rates per 10,000 population for the ambulatory care sensitive conditions. The top 2 conditions were chosen from the 2014 ACSC analysis. To analyze the trend, the rates were compared to the rates for these conditions for 2012 and 2013 hospitalization dataset. In addition, to calculating the New Mexico rates for the top 2 conditions, rates by health region were also calculated to identify trends within the regions.

Definitions: Definitions for diagnoses and procedures presented in this report may be found at <http://www.cdc.gov/nchs/icd/icd9cm.htm>.

Key Findings

Demographic Characteristics of Discharged Patients

- Among patients less than 15 years old, 55.0% were male. Among patients 15-44 years old, 74.2% were female. The discharge rate among females aged 15-44 was 940.7 per 10,000 population compared to 317.6 per 10,000 for male patients in the same age group.
- Among all five health regions, there were more female discharged patients compared to male discharged patients.
- The Southeast region had the highest discharge rate for females at 912.8 per 10,000 population and the highest overall discharge rate (both males and females combined) at 740.7 per 10,000 population. The highest discharge rate for males was in the Northwest region at 666.2 per 10,000 population. These trends are similar to 2013 HIDD results, but the discharge rates were lower in 2014.
- From 2011-2014, there has been a slight decrease in the discharge rate of females for four health regions, the exception being the Metro region. Among male patients, a similar trend was observed with discharge rate decreases for four of the five health regions.
- Comparing discharge rates between New Mexico (2012-2014) and the U.S. (2010), New Mexico had lower discharge rates for all 4 age groups (<15 Years, 15-44 Years, 45-64 Years, and 65+ Years), as well as for both males and females.
- Patients who were between the ages of 15-44 years had the lowest average length of stay. Patients who were less than 15 years old had the longest average length of stay.

Discharges by National Center for Health Statistics Top 21 Diagnoses

- The top five reasons for hospitalization by category of the NCHS top 21 diagnoses for males were Heart Disease (6,673), Psychoses* (4,151), Septicemia (4,139), Pneumonia (3,005), and Fractures (2,201). The number of hospitalizations for Psychoses, Septicemia, and Pneumonia increased from 2013 to 2014.
- The top five reasons for hospitalization by category of NCHS top 21 diagnoses for females were Heart Disease (5,561), Septicemia (4,395), Psychoses* (3,628), Pneumonia (3,106), and Fractures (2,934). The number of hospitalizations for Septicemia and Pneumonia increased from 2013 to 2014.
- The overall state rate for Pneumonia, Septicemia, and Psychoses* increased from 2013 to 2014; 26.9 to 27.7, 31.7 to 38.3, and 36.8 to 37.9 respectively.
- The top reason for hospitalization by category of NCHS top 21 diagnoses for patients less than 15 years old was Pneumonia (1,015), among patients 15-44 years was Psychoses* (4,063), among patients 45-64 years was Heart Disease (3,619), and among patients 65 or older was Heart Disease (7,798).
- The top reason for hospitalization by category of NCHS top 21 diagnoses for the Northwest, Northeast, Metro, and Southwest regions was Heart Disease (1,279; 1,657; 5,253; and 2,409 respectively). The top reason for hospitalization in the Southeast region was Psychoses* (1,774).

*See notation on page 7 regarding Specialty Hospitals.

Key Findings

Patient Discharge Status

- Among male and female patients, 70% and 75% of the discharges were routine, respectively. Transfers/discharges to another skilled facility/hospital occurred 20% and 17% of the time, respectively.
- Among female patients, 590 (0.6%) left against medical advice and 1,465 (1.6%) died during their hospital stay.
- Among male patients, 936 (1.5%) left against medical advice and 1,709 (2.7%) died during their hospital stay.
- The rate of patients leaving against medical advice increased from 2011 to 2014 among patients aged 15-44, 45-64, and 65+ years.
- The Southeast region had the largest increase in the rate of patients leaving against medical advice, increasing from 7.5 per 10,000 population in 2011 to 11.0 per 10,000 population in 2014.
- The rate of patients who died while an inpatient remained relatively constant from 2011 to 2014 for all age groups except patients 65+ years.
- The Northwest and Metro regions had increases in the rate of patients who died while an inpatient; increasing from 20.2 per 10,000 population in 2013 to 21.2 per 10,000 population in 2014 and 12.4 per 10,000 population in 2013 to 13.3 per 10,000 population in 2014, respectively.

Primary Payer Types

- The age adjusted rate of Medicaid discharges increased from 2012 to 2014. With increases in Medicaid discharge rates for four of the health regions; the Southeast region saw a decrease from 2012 to 2014.

Ambulatory Care Sensitive Conditions (ACSC)

- Bacterial Pneumonia has remained the condition with the highest hospitalization rate for the three year period (2012-2014).
- From 2012-2014, the rates for Bacterial Pneumonia decreased in the Northeast health region. However, Bacterial Pneumonia rates have increased slightly in the last three years in the other four health regions.
- For 2014, the Southeast region had the highest rates for Acute ACSC at 45.0 per 10,000 population. The Southeast region also had the highest rates for Chronic ACSC (42.0 per 10,000 population).

Out of State Hospitalizations for New Mexico Residents

- For 2013, Arizona hospitals provided services for 4,933 hospital discharges for New Mexico residents. The top NCHS health category for these hospital admissions was Malignant Neoplasms, followed closely by Heart Disease.
- For 2013, Colorado hospitals provided services for 1,986 hospital discharges for New Mexico residents. The top NCHS health category for these hospital admissions was Osteoarthritis and Allied Disorders.
- For 2013, Texas hospitals provided services for 16,894 hospital discharges for New Mexico residents. The top NCHS health category for these hospital admissions was Heart Disease.

New Mexico Health and Human Services Regions

- Region 1 - Northwest
- Region 2 – Northeast
- Region 3 – Metro
- Region 4 – Southeast
- Region 5 – Southwest
- Hospital

Arizona Hospitalization Data for New Mexico Residents

Figure 23. Percent of Arizona Hospitalizations based on New Mexico Patient Residence, 2013

In 2013, Arizona hospitals provided services for 4,933 hospital discharges for New Mexico residents. When the Arizona hospitalizations were added to the New Mexico HIDD dataset, there was a total of 195,169 hospital discharges. Arizona hospital discharges accounted for 2.5% of the total NM-HIDD + Arizona data. Although this percentage is below 5%, in Catron county, Arizona hospitalization data accounted for 67.6% of all hospitalization data for Catron county residents. A high percentage was also observed for Hidalgo county residents. The top NCHS health category for these hospital discharges was Malignant Neoplasms, followed closely by Heart Disease.

Data Source: Arizona Department of Health Services.

*Except for age-specific rates, all rates are age-adjusted to the 2000 U.S. standard population

Colorado Hospitalization Data for New Mexico Residents

Figure 24. Percent of Colorado Hospitalizations based on New Mexico Patient Residence, 2013

In 2013, Colorado hospitals provided services for 1,986 hospital discharges for New Mexico residents. When the Colorado hospitalizations were added to the New Mexico HIDD dataset, there was a total of 192,122 hospital discharges. Colorado hospital discharges accounted for 1.0% of the total NM-HIDD + Colorado data. Although this percentage is below 5%, in Colfax county, Colorado hospitalization data accounted for 14.4% of all hospitalization data for Colfax county residents. A high percentage was also observed for San Juan county residents. The top NCHS health category for these hospital discharges was Osteoarthritis and Allied Disorders.

Data Source: Colorado, State Inpatient Databases (SID), Healthcare Cost and Utilization Project (HCUP), Agency for Health Care Research and Quality.

*Except for age-specific rates, all rates are age-adjusted to the 2000 U.S. standard population

Texas Hospitalization Data for New Mexico Residents

Figure 25. Percent of Texas Hospitalizations based on New Mexico Patient Residence, 2013

In 2013, Texas hospitals provided services for 16,894 hospital discharges for New Mexico residents. When the Texas hospitalizations were added to the New Mexico HIDD dataset, there was a total of 207,130 hospital discharges. Texas hospital discharges accounted for 8.2% of the total NM-HIDD + Texas data. Although this percentage is below 10%, in Union county, Texas hospitalization data accounted for 38.0% of all hospitalization data for Union county residents. A high percentage was also observed for Quay and Lea county residents. The top NCHS health category for these hospital discharges was Heart Disease.

Data Source: Texas Department of State Health Services.

*Except for age-specific rates, all rates are age-adjusted to the 2000 U.S. standard population

Hospitalization Data for New Mexico Residents

Figure 26. Hospitalization Rates (per 10,000 Population) based on New Mexico Patient Residence, 2013

In 2013, non-federal, general acute and specialty facilities provided services for 190,236 discharges for New Mexico residents. Additional discharge information from federal and out-of-state hospitals/facilities increased the number of discharges for New Mexico residents to 218,421 discharges. The top NCHS health categories for all New Mexico resident hospital discharges was Other Diagnoses, Heart Disease, and Psychoses. The crude rate of hospitalizations for New Mexico residents in 2013 was 1,042.5 hospitalizations per 100,000 population.

*Except for age-specific rates, all rates are age-adjusted to the 2000 U.S. standard population
