Diagnosis	39
-----------------	----

Executive Summary

The NMDOH maintains the Hospital Inpatient Discharge Database (HIDD). This report is based on data generated from the HIDD. The hospital inpatient diagnoses contained in the database were coded using both the International Classification of Diseases, Ninth and Tenth Revision, Clinical Modification (ICD-9-CM and ICD-10-CM). General and specialty hospitals in the state are annually required to report hospital inpatient discharge data to the NMDOH. Federal facilities are not required to report HIDD data to the NMDOH. Therefore, data from Indian Health Service (IHS) facilities and the Veterans Affairs (VA) Hospital are not included. However, the NMDOH is exploring ways to access and include IHS and VA Hospital data in future reports.

An inpatient discharge occurs when a patient is admitted overnight to a hospital and leaves that hospital. Thus, an individual who is transferred from hospital A to hospital B would be included in the discharges from hospital A with a second discharge from hospital B.

This report presents overall New Mexico hospital inpatient discharge numbers, rates, and average lengths of stay by age, sex and region. In 2015, 36 general and 16 specialty hospitals reported hospital inpatient discharge data to the NMDOH. These 36 non-federal, general hospitals reported a total of 152,436 discharges for New Mexico state residents (data from specialty hospitals were not included in this report). Duplicate records and records with out-of-state or unknown zip codes, unknown age, unknown sex, unknown or invalid primary diagnosis codes and discharges that were not inpatient discharges were excluded from this count. Discharges of newborns were also excluded to be consistent with federal reporting standards.

Of the 152,436 reported discharges, approximately 59 percent were among females and 41 percent were among males. Thirty-six percent of all discharges occurred among residents over the age of 64 years. The highest discharge rate by region was 691.2 discharges per 10,000 population in the Southwest Region, and the lowest rates were in the Northeast region (670.8 discharges per 10,000 population).

Methods

Although data is verified with the submitting hospital, all data and information presented in this report are as submitted by reporting hospitals to the NMDOH. The original data is the responsibility of the submitting hospital.

Some records were excluded from the data reported. As indicated in the table below, duplicate records and records with out-of-state or unknown zip codes, unknown age, unknown sex, unknown or invalid primary diagnosis codes and discharges that were not inpatient discharges or discharges from specialty hospitals (N=14,862 discharges) were excluded. Discharges of newborns were excluded to be consistent with federal reporting standards. At this time, specialty hospitals (rehabilitation and behavioral health facilities) are not included in this report due to an incomplete dataset for this reporting year or for previous years (impact on trend analysis). In the future, we plan to gather data from all available specialty hospitals to better represent behavioral health discharges in New Mexico.

Excluded Records 2015 HIDD	
Total Records Collected	183,258
Duplicates	
Unknown Age (N=0)	
Unknown Sex (N=17)	
Out-of-State or Unknown Zip Code (N=6,822)	
Invalid Diagnosis Code (Primary Diagnosis=000.8) (N=0)	
Unknown Primary Diagnosis (N=51)	
Newborns (N=22,783)	
Not an Inpatient Record (N=2,919)	
Remaining Records Used in 2015 HIDD Reporting	152,436

Note: The exclusion criteria above is not mutually exclusive. For example, a record may have both unknown sex and unknown primary diagnosis.

Methods

New Mexico Hospital Inpatient Discharge Data: The New Mexico Health Information System (HIS) was established in 1989 pursuant to the Health Information System Act, Section 24-14A-1 through Section 24-14A-10 NMSA 1978. The NMDOH is charged with creating rules regarding the collection, use and reporting of these data (NMAC 7.1.27). The rule relates to several specific areas, including specific information to be reported by state licensed general and specialty hospitals, the data access policy and public reporting requirements.

All New Mexico general and specialty hospitals are required to report hospital inpatient discharge data to the NMDOH quarterly (not including federal hospitals). The NMDOH maintains the Hospital Inpatient Discharge Database (HIDD). The 2015 New Mexico data presented in this report was generated from the HIDD. The HIDD dataset is uploaded to NMDOH's public health information resource: NM-IBIS (<https://ibis.health.state.nm.us/>). The majority of the tables and graphs included in this report were generated from queries completed on this platform. At this time, NM-IBIS does not include information on out-of-state hospitalizations for NM residents nor hospitalization data from Indian Health Service (IHS) facilities.

United States Hospital Inpatient Discharge Data: U.S. data used for comparison with New Mexico data were provided by the National Center for Health Statistics' (NCHS) National Health Statistics Reports. The report presents the most current nationally representative data on inpatient care, excluding newborns, in the U.S. Data are from the 2010 National Hospital Discharge Survey, the longest continuously running nationally representative survey of hospital utilization. This survey is a probability sample survey of non-federal hospitals.

State Population Estimates: State population estimates used for the denominator in hospitalization discharge rates were generated by the NM Population Estimates, Geospatial and Population Studies (GPS) Program, University of New Mexico (<http://gps.unm.edu/>). The GPS evaluates all input data and employs a housing unit-based methodology, validated by building permits and birth/death records. Population denominator estimates for 2015 were used. Population estimates from UNM were recently updated in October 2016. These estimates were expanded to include 2015 population estimates, but also update population estimates from 2010 to the present. For this report, trend analysis that includes previous years will reflect the new population estimates. Rates were age-adjusted to the 2000 U.S. standard population, when indicated.

Ambulatory Care Sensitive Conditions: High rates of ambulatory care sensitive conditions (ACSC) are an indication of a lack of access to, availability of, or quality of primary care services. Quality and availability of primary care services is illustrated by low rates of ACSC. ACSC are illnesses that can often be managed effectively on an outpatient basis and generally do not result in hospitalization if managed properly. These conditions include, but are not limited to bacterial pneumonia and congestive heart failure. These conditions commonly impact a large number of people and often result in unnecessary hospitalizations. This causes health care costs to increase, which could be avoided through available, quality primary care.

The Agency of Healthcare Quality and Research's (AHRQ) Prevention Quality Indicators calculation methods were used for this analysis (http://www.qualityindicators.ahrq.gov/Modules/PQI_TechSpec.aspx). The New Mexico Hospital Inpatient Discharge Database (NM-HIDD) for 2015 was used to calculate age-adjusted rates per 10,000 population for the ambulatory care sensitive conditions. The top 2 conditions were chosen from the 2015 ACSC analysis. To analyze the trend, the rates were compared to the rates for these conditions for 2013 and 2014 hospitalization dataset. In addition, to calculating the New Mexico rates for the top 2 conditions, rates by health region were also calculated to identify trends within the regions.

Definitions: Definitions for diagnoses and procedures presented in this report may be found at <http://www.cdc.gov/nchs/icd/icd9cm.htm> and <http://www.cdc.gov/nchs/icd/icd10cm.htm>.

Key Findings

New Mexico Hospitals

- The three hospitals with the highest number of inpatient discharges in 2015 were Presbyterian Hospital in Albuquerque (24,746 discharges), UNM Hospital in Albuquerque (21,197 discharges), and Christus St. Vincent Regional Medical Center in Santa Fe (10,601 discharges).

Demographic Characteristics of Discharged Patients

- Among patients less than 15 years old, 54.8% were male. Among patients 15-44 years old, 74.3% were female. The discharge rate among females aged 15-44 was 916.5 per 10,000 population compared to 300.6 per 10,000 population for male patients in the same age group.
- For each of the five health regions, there were more female discharged patients compared to male discharged patients.
- The Southeast Region had the highest discharge rate for females at 859.0 per 10,000 population. The highest discharge rate for males was in the Northwest Region at 645.2 per 10,000 population. These trends by patient sex are similar to 2014 HIDD results, but the discharge rates were lower in 2015. The Southwest Region had the highest overall discharge rate (both males and females combined) at 691.2 per 10,000 population (this is a change from previous annual reports where the Southeast Region had the highest overall discharge rate).
- From 2012-2015, there has been a decrease in the discharge rate of females for each of the five health regions. Among male patients, the discharge rate decreased for four of the five health regions. The Metro Region was an exception where the rate increased from 2012 to 2015.
- Patients who identify as American Indian and were less than 15 years old had higher discharge rates compared to patients who identified as non-Hispanic White or Hispanic and less than 15 years old.
- Comparing discharge rates between New Mexico (2013-2015) and the U.S. (2010), New Mexico had lower discharge rates for all 4 age groups (<15 Years, 15-44 Years, 45-64 Years, and 65+ Years), as well as for both males and females.
- Patients aged 15-44 years had the lowest average length of stay. Patients aged 45-64 years old had the longest average length of stay.

Discharges by Category of First-Listed Diagnosis

- Overall discharge rates have decreased from 2013 to 2015 (6.4% decrease). Discharges where the primary diagnosis was for Infectious and Parasitic Disease or Mental Disorders have seen an increase in discharge rates. The other 17 groupings have either seen no change or a decrease in discharge rates.
- The top five reasons for hospitalization by category of first-listed diagnosis for males were Diseases of the Circulatory System (10,221), Diseases of the Digestive System (8,513), Diseases of the Respiratory System (7,679), Infectious and Parasitic Diseases (6,586), and Injury and Poisoning (6,192).
- The top five reasons for hospitalization by category of first-listed diagnosis for females were Diseases of the Digestive System (8,959), Diseases of the Circulatory System (8,716), Diseases of the Respiratory System (7,625), Injury and Poisoning (6,765), and Infectious and Parasitic Diseases (6,745).
- In 2015, there were 22,098 inpatient hospitalizations due to a pregnancy diagnosis/outcome.
- The top reason for hospitalization by category of first-listed diagnosis for patients living in the Northwest and Southeast Regions was Diseases of the Respiratory System (1,896 and 2,560, respectively), in the Northeast Region was Diseases of the Digestive System (2,889), and in the Metro and Southwest Regions was Diseases of the Circulatory System (8,325 and 3,659, respectively).

Key Findings

Patient Discharge Status

- Among male and female patients, 68.5% and 75.1% of the discharges were routine, respectively. Transfers/ discharges to another skilled facility/hospital occurred 21.0% and 17.7% of the time, respectively.
- Among female patients, 544 (0.1%) left against medical advice and 1,418 (1.6%) died during their hospital stay.
- Among male patients, 1,042 (1.7%) left against medical advice and 1,772 (2.8%) died during their hospital stay.
- The rate of patients leaving against medical advice increased from 2012 to 2015.
- The Metro Region had the largest increase in the rate of patients leaving against medical advice, increasing from 5.7 per 10,000 population in 2012 to 8.2 per 10,000 population in 2015.
- The rate of patients who died while an inpatient remained relatively constant from 2012 to 2015 for all age groups except patients 65+ years.
- The Northeast Region had an increase in the rate of patients who died while an inpatient; increasing from 14.1 per 10,000 population in 2014 to 15.7 per 10,000 population in 2015.

Primary Payer Types

- The age adjusted rate of Medicaid discharges increased from 2013 to 2015. Increases in Medicaid discharge rates occurred in four of the health regions; the Southeast Region saw a decrease from 2014 to 2015.

Ambulatory Care Sensitive Conditions (ACSC)

- From 2013-2015, the rates for Bacterial Pneumonia decreased in the Northwest, Northeast and Metro Regions. However, Bacterial Pneumonia rates have increased slightly in the last three years in the Southwest Region.
- For 2015, the Southeast Region had the highest rates for Acute ACSC at 45.0 per 10,000 population. The Southeast Region also had the highest rates for Chronic ACSC (42.0 per 10,000 population).

Out of State Hospitalizations for New Mexico Residents

- For 2014, Arizona hospitals provided services for 4,943 hospital discharges for New Mexico residents. The top NCHS health category for these hospital admissions was Malignant Neoplasms, followed closely by Heart Disease.
- For 2014, Colorado hospitals provided services for 2,066 hospital discharges for New Mexico residents. The top NCHS health category for these hospital admissions was Osteoarthritis and Allied Disorders.
- For 2014, Texas hospitals provided services for 17,577 hospital discharges for New Mexico residents. The top NCHS health category for these hospital admissions was Heart Disease.
- For 2014, Indian Health Service (IHS) hospitals provided services for 4,674 hospital discharges for New Mexico residents. IHS hospitalization data accounted for 36.3% of all hospitalization data for McKinley County residents.
- When accounting for all available hospitalization data from general, acute facilities for NM residents, there were 184,266 total discharges. The crude rate of hospitalizations for New Mexico residents in 2014 was 878.1 hospitalizations per 10,000 population.

New Mexico Health and Human Services Regions

-  Region 1 - Northwest
-  Region 2 - Northeast
-  Region 3 - Metro
-  Region 4 - Southeast
-  Region 5 - Southwest

** AHRQ methods produce results at a rate per 100,000 Population. For this report, a rate of 10,000 per Population was used to be consistent with rates throughout this report.

Arizona Hospitalization Data for New Mexico Residents

Figure 24. Percent of Arizona Hospitalizations based on New Mexico Patient Residence, 2014

In 2014, Arizona hospitals provided services for 4,943 hospital discharges for New Mexico residents. When the Arizona hospitalizations were added to hospitalization data for all NM residents, there was a total of 184,266 hospital discharges. Arizona hospital discharges accounted for 2.7% of the total NM resident hospital data. A high percentage of discharges were observed for residents of Catron and Hidalgo counties. The top NCHS health category for these hospital discharges was Malignant Neoplasms, followed closely by Heart Disease.

Data Source: Arizona Department of Health Services.

*Except for age-specific rates, all rates are age-adjusted to the 2000 U.S. standard population

Colorado Hospitalization Data for New Mexico Residents

Figure 25. Percent of Colorado Hospitalizations based on New Mexico Patient Residence, 2014

In 2014, Colorado hospitals provided services for 2,066 hospital discharges for New Mexico residents. When the Colorado hospitalizations were added to hospitalization data for all NM residents, there was a total of 184,266 hospital discharges. Colorado hospital discharges accounted for 1.1% of the total NM resident hospital data. Colorado hospitalization data accounted for 19.3% of all hospitalization data for Colfax County residents. A high percentage was also observed for residents of Harding and San Juan counties. The top NCHS health category for these hospital discharges was Osteoarthritis and Allied Disorders.

Data Source: Colorado, State Inpatient Databases (SID), Healthcare Cost and Utilization Project (HCUP), Agency for Health Care Research and Quality.

*Except for age-specific rates, all rates are age-adjusted to the 2000 U.S. standard population

Texas Hospitalization Data for New Mexico Residents

Figure 26. Percent of Texas Hospitalizations based on New Mexico Patient Residence, 2014

In 2014, Texas hospitals provided services for 17,577 hospital discharges for New Mexico residents. When the Texas hospitalizations were added to hospitalization data for all NM residents, there was a total of 184,266 hospital discharges. Texas hospital discharges accounted for 9.5% of the total NM resident hospital data. Texas hospitalization data accounted for 42.5% of all hospitalization data for Lea County residents. A high percentage was also observed for residents of Harding and Roosevelt counties. The top NCHS health category for these hospital discharges was Heart Disease.

Data Source: Texas Department of State Health Services.

*Except for age-specific rates, all rates are age-adjusted to the 2000 U.S. standard population

IHS Hospitalization Data for New Mexico Residents

Figure 27. Percent of IHS Hospitalizations based on New Mexico Patient Residence, 2014

In 2014, Indian Health Service (IHS) hospitals provided services for 4,674 hospital discharges for New Mexico residents. When the IHS hospitalizations were added to hospitalization data for all NM residents, there was a total of 184,266 hospital discharges. IHS hospital discharges accounted for 2.5% of the total NM resident hospital data. IHS hospitalization data accounted for 36.3% of all hospitalization data for McKinley County residents. A high percentage was also observed for residents of Cibola and San Juan counties.

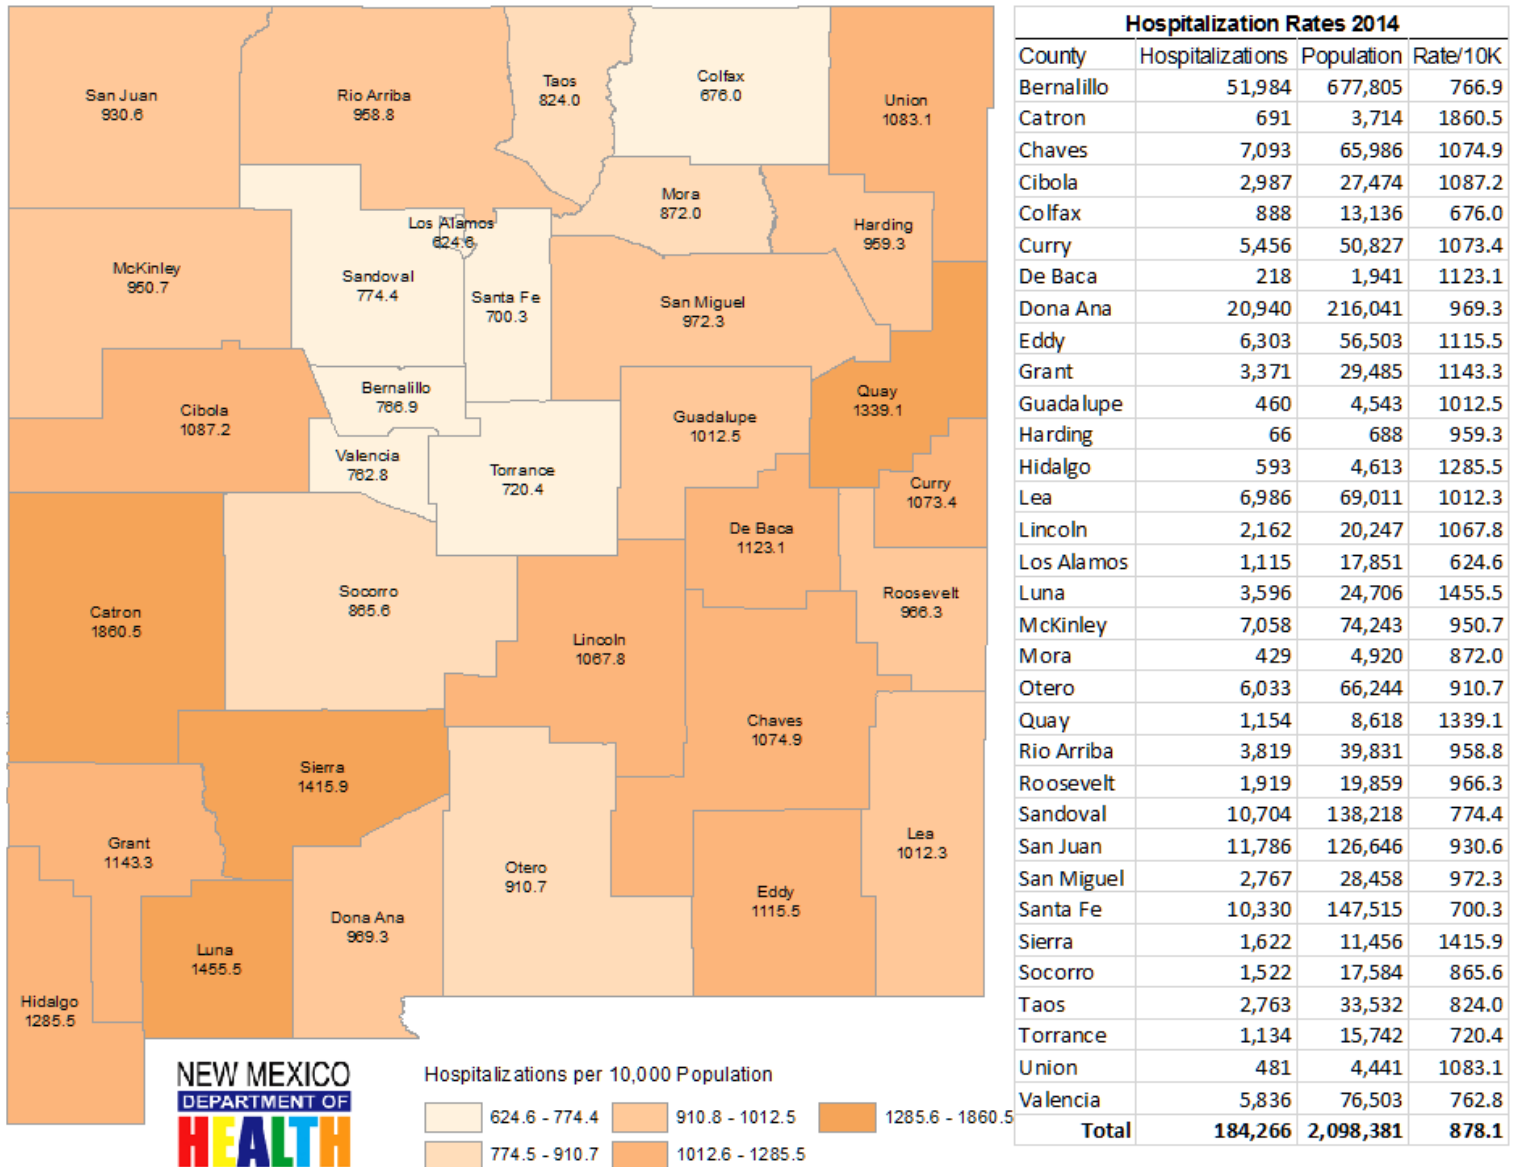

Data Source: Indian Health Services.

*Except for age-specific rates, all rates are age-adjusted to the 2000 U.S. standard population

Hospitalization Data for New Mexico Residents

Figure 28. Hospitalization Rates (per 10,000 Population) based on New Mexico Patient Residence, 2014

In 2014, general acute facilities throughout NM and in neighboring states, provided services for 184,266 discharges for New Mexico residents. The top NCHS health categories for all New Mexico resident hospital discharges was Other Diagnoses, Heart Disease, and Certain Complications of Surgical and Medical Care. The crude rate of hospitalizations for New Mexico residents in 2014 was 878.1 hospitalizations per 10,000 population.

*Except for age-specific rates, all rates are age-adjusted to the 2000 U.S. standard population
