Executive Summary

The NMDOH maintains the Hospital Inpatient Discharge Database (HIDD). This report is based on data generated from the HIDD. The hospital inpatient diagnoses contained in the database were coded using the International Classification of Diseases, Tenth Revision, Clinical Modification (ICD-10-CM). General and specialty hospitals in the state are annually required to report hospital inpatient discharge data to the NMDOH. Federal facilities are not required to report HIDD data to the NMDOH. Therefore, data from Indian Health Service (IHS) facilities and the Veterans Affairs (VA) Hospital are not included. However, the NMDOH is exploring ways to include IHS and VA Hospital data in future reports.

An inpatient discharge occurs when a patient is admitted overnight to a hospital and leaves that hospital. Thus, an individual who is transferred from hospital A to hospital B would be included in the discharges from hospital A with a second discharge from hospital B.

This report presents overall New Mexico hospital inpatient discharge numbers, rates, and average lengths of stay by age, sex and region. In 2017, 36 general and 16 specialty hospitals reported hospital inpatient discharge data to the NMDOH. These 36 non-federal, general hospitals reported a total of 154,805 discharges for New Mexico state residents (data from specialty hospitals were not included in this report). Duplicate records and records with out-of-state or unknown zip codes, unknown age, unknown sex, unknown or invalid primary diagnosis codes and discharges that were not inpatient discharges were excluded from this count. Discharges of newborns were also excluded to be consistent with federal reporting standards.

Of the 154,805 reported discharges, approximately 57 percent were among females and 43 percent were among males. Thirty-eight percent of all discharges occurred among residents aged 65 years and older. The highest discharge rate by region was 725.7 discharges per 10,000 population in the Southwest Region, and the lowest rate was in the Southeast Region (575.3 discharges per 10,000 population).

Methods

Although data are verified with the submitting hospital, all data and information presented in this report are as submitted by reporting hospitals to the NMDOH. The original data are the responsibility of the submitting hospital.

Some records were excluded from the data reported. As indicated in the table below, duplicate records and records with out-of-state or unknown zip codes, unknown age, unknown sex, unknown or invalid primary diagnosis codes and discharges that were not inpatient discharges or discharges from specialty hospitals (N=17,448 discharges) were excluded. Discharges of newborns were excluded to be consistent with federal reporting standards. At this time, specialty hospitals (rehabilitation and behavioral health facilities) are not included in this report due to an incomplete dataset for this reporting year or for previous years.

Record Exclusion 2017 HIDD	
Total Records Collected	183,876
Duplicates	0
Unknown Age	4
Unknown Sex	11
Out-of-State or Unknown Zip Code	5,807
Missing Primary Diagnosis Code	14
Newborns	20,498
Not an Inpatient Record	2,915
Remaining Records	154,805

Note: The exclusion criteria above are not mutually exclusive. For example, a record may have both unknown sex and unknown primary diagnosis.

New Mexico Hospital Inpatient Discharge Data: The New Mexico Health Information System (HIS) was established in 1989 pursuant to the Health Information System Act, Section 24-14A-1 through Section 24-14A-10 NMSA 1978. The NMDOH is charged with creating rules regarding the collection, use and reporting of these data (NMAC 7.1.27). The rule relates to several specific areas, including specific information to be reported by state licensed general and specialty hospitals, the data access policy and public reporting requirements.

All New Mexico non-federal, general and specialty hospitals are required to report hospital inpatient discharge data to the NMDOH quarterly. The NMDOH maintains the Hospital Inpatient Discharge Database (HIDD). The 2017 New Mexico data presented in this report was generated from the HIDD. The HIDD dataset is uploaded to NMDOH's public health information resource: NM-IBIS (<https://ibis.health.state.nm.us/>). At this time, NM-IBIS does not include information on out-of-state hospitalizations for NM residents nor hospitalization data from Indian Health Service (IHS) facilities.

United States Hospital Inpatient Discharge Data: U.S. data used for comparison with New Mexico data were provided by the National Center for Health Statistics' (NCHS) National Health Statistics Reports. The report presents the most current nationally representative data on

inpatient care, excluding newborns, in the U.S. Data are from the 2010 National Hospital Discharge Survey, the longest continuously running nationally representative survey of hospital utilization. This survey is a probability sample survey of non-federal hospitals.

State Population Estimates: State population estimates used for the denominator in hospitalization discharge rates were generated by the NM Population Estimates, Geospatial and Population Studies (GPS) Program, University of New Mexico (<http://gps.unm.edu/>). The GPS evaluates all input data and employs a housing unit-based methodology, validated by building permits and birth/death records. Population denominator estimates for 2017 were used. Population estimates from UNM were recently updated in October 2017. These estimates were expanded to include 2017 population estimates, but also updated population estimates from 2010 to the present. For this report, trend analysis that includes previous years will reflect the new population estimates.

Ambulatory Care Sensitive Conditions: High rates of ambulatory care sensitive conditions (ACSC) are an indication of a lack of access to, availability of, or quality of primary care services. Quality and availability of primary care services is illustrated by low rates of ACSC. ACSC are illnesses that can often be managed effectively on an outpatient basis and generally do not result in hospitalization if managed properly. These conditions include, but are not limited to, bacterial pneumonia and congestive heart failure. These conditions commonly impact a significant number of people and often result in unnecessary hospitalizations. This causes health care costs to increase, which could be avoided through available, quality primary care.

The Agency of Healthcare Quality and Research's (AHRQ) Prevention Quality Indicators calculation methods were used for this analysis (http://www.qualityindicators.ahrq.gov/Modules/PQI_TechSpec.aspx). The New Mexico Hospital Inpatient Discharge Database (NM-HIDD) for 2017 was used to calculate age-adjusted rates per 10,000 population for the ambulatory care sensitive conditions. It should be noted that the AHRQ rates are usually per 100,000 population; the rate per 10,000 was used here in order to be consistent with the other rate calculations. The top 2 conditions were chosen from the 2017 ACSC analysis. To analyze the trend, the rates were compared to the rates for these conditions from the 2015 and 2016 hospitalization datasets. In addition, to calculating the New Mexico rates for the top 2 conditions, rates by health region were also calculated to identify trends within the regions.

Definitions: Definitions for diagnoses and procedures presented in this report may be found at <http://www.cdc.gov/nchs/icd/icd10cm.htm>.

Rate Calculations: all rates presented are per 10,000 population. Rates were age-adjusted to the 2000 U.S. standard population unless age groups are specified. If age groups are specified (4 age groups, <15, 15-44, 45-64, 65+ years), then age-specific rates are reported.

Key Findings

New Mexico Hospitals

- The three hospitals with the highest number of inpatient discharges in 2017 were Presbyterian Hospital in Albuquerque (23,744 discharges), UNM Hospital in Albuquerque (22,647 discharges), and Lovelace Medical Center Downtown in Albuquerque (11,502 discharges).

Demographic Characteristics of Discharged Patients

- Among patients less than 15 years old, 54.8% were male. Among patients 15-44 years old, 72.7% were female. The discharge rate among females aged 15-44 was 874.5 per 10,000 population compared to 312.9 per 10,000 population for male patients in the same age group.
- For each of the five health regions, there were more female discharged patients compared to male discharged patients.
- The Southwest Region had the highest discharge rate for females at 828.5 per 10,000 population. The highest discharge rate for males was in the Northwest Region at 661.1 per 10,000 population. The Southwest Region had the highest overall discharge rate (both males and females combined) at 725.7 per 10,000 population.
- African American and White females had the highest discharge rates: 969.9 and 888.9 per 10,000 population respectively.
- New Mexico's discharge rates for ages 45-64 and 65+ in 2017 were much lower than the discharge rates for those age groups for the United States in 2010.

Discharges by Category of First-Listed Diagnosis

- Other than pregnancy diagnoses, the highest number of discharges and highest discharge rates per 10,000 population was in the category of "Diseases of the circulatory system" for both males and females. The total number of discharges in this category was 19,541 with a discharge rate of 77.7 per 10,000 population. In this category males had 10,630 discharges with a rate of 90.7, and females had 8,911 discharges with a rate of 66.1. This was followed closely by "Diseases of the digestive system," with 8,641 discharges (rate: 80.2) and 8,844 discharges (rate: 75.1) for males and females respectively.
- In terms of discharges by age groups, for ages 65+ years, "Diseases of the circulatory system" was highest with 12,619 discharges (rate: 355.4). For ages 45-64 years, "Diseases of the digestive system" had the highest number of discharges, 6,023 (rate: 115.0). For ages 15-44, "Mental, behavioral and neurodevelopmental disorders" was highest: 5,378 (rate: 65.9). For ages <15 years, "Diseases of the respiratory system" was highest: 3,131 discharges (rate 76.9). Pregnancy diagnoses (in any diagnosis field) was highest in ages 15-44, with 20,423 discharges (rate: 250.2).
- By health region, "Diseases of the circulatory system" was the category with the highest discharge rates for the Metro and Southwest Regions. For the Southeast Region, "Diseases of the respiratory system" was highest with 2,072 discharges (rate: 64.8). For

the Northeast and Northwest Regions, “Diseases of the digestive system” had the highest discharge rates with 2,929 discharges (rate: 81.6) for the Northeast and 1,805 discharges (rate: 90.2) for the Northwest. Pregnancy diagnosis in any diagnosis field had the highest rate in the Southwest Region with 3,994 discharges (rate: 108.5).

Discharges by Discharge Status

- Routine discharges accounted for 70.5% of total discharges (109,153/154,805). There was a higher percentage of females with routine discharges than males, 59.5% and 40.5% respectively (64,957 and 44,196 discharges.) The second highest discharge status was discharges/transfers to home on care of a home health service organization.
- The rate of “left against medical advice” discharges was highest in 2017 for ages 45-64 (rate: 12.8). This rate was highest in the Northeast Region (rate: 11.0) in 2017.
- The rate of discharge deaths was highest in the 65+ age group. This rate for 2017 (55.8) decreased from the 2016 rate (62.7). The discharge death rate was highest in the Northwest Region in 2017 (19.4), but was a decrease from the Northwest’s 2016 rate (21.0).

Discharges by Primary Payer Type

- Medicare had the highest rate of discharges in 2017 (253.5), followed by Medicaid (228.6), then other types of insurance (199.5).
- The Medicare discharge rate was highest in the Southwest Region in 2017 (298.8), showing an increase from that region’s 2016 rate (276.6).
- The Medicaid discharge rate was highest in the Northwest Region (255.3) in 2017, showing a decrease from the 2016 rate (272.5).
- The discharge rate for Other Insurance was highest in the Metro Region in 2017 (210.6).

Ambulatory Care Sensitive Conditions

- The overall rate of Acute ACSC decreased in 2017 (29.7) from the 2016 rate (37.1). However, the overall rate for Chronic ACSC increased in 2017 (46.4) from the 2016 rate (43.8).
- The ACSC rate was highest in the Southwest Region in 2017 (97.2). This was a decrease from the region’s 2016 rate (104.6).
- The Acute ACSC condition with the highest rate in 2017 was bacterial pneumonia. This was highest in the Southwest Region (18.2) but was a considerable decrease from the region’s 2016 rate (29.2).
- The Chronic ACSC condition with the highest rate in 2017 was heart failure. The 2017 rate was highest in the Southwest Region (32.5), a marked increase from the region’s 2016 rate (24.8).

Out of State Hospitalizations for New Mexico Residents (2016)

- Arizona hospitals provided services for 5,299 hospital discharges for NM residents, which accounted for 2.6% of the total NM resident hospital data. The highest percentage of these discharges were in the western NM counties.
- Colorado hospitals provided services for 2,243 hospital discharges for NM residents. Colorado hospital discharges accounted for 1.1% of the total NM resident hospital data. The highest percentage of these discharges were in the northern NM counties.
- Texas hospitals provided services for 19,352 hospital discharges for New Mexico residents. Texas hospital discharges accounted for 9.5% of the total NM resident hospital data. The highest percentage of these discharges were in the eastern NM counties as well as Doña Ana county.
- New Mexico facilities and facilities in neighboring states provided services for 203,304 hospitalizations for New Mexico residents. The rate of hospitalizations for NM residents in 2016 was 921.3 hospitalizations per 10,000 population.

New Mexico Health Regions

Northwest Region: San Juan, McKinley, and Cibola Counties

Northeast Region: Rio Arriba, Taos, Colfax, Union, Los Alamos, Santa Fe, Mora, San Miguel, Guadalupe, and Harding counties

Metro Region: Bernalillo, Sandoval, Torrance, and Valencia counties

Southeast Region: Quay, DeBACA, Curry, Lincoln, Roosevelt, Chaves, Eddy, and Lea counties

Southwest Region: Catron, Socorro, Grant, Sierra, Hidalgo, Luna, Doña Ana, Otero counties

Arizona Hospitalization Data for New Mexico Residents

Figure 20. Percent of Arizona Hospitalizations based on New Mexico Patient Residence, 2016

In 2016, Arizona hospitals provided services for 5,299 hospital discharges for New Mexico residents. Arizona hospital discharges accounted for 2.6% of the total NM resident hospital data. A high percentage of discharges were observed for residents of Catron and Hidalgo counties. The top first listed major diagnostic category for these hospital discharges was Injury and Poisoning, followed closely by Symptoms, Signs, and Ill-Defined Conditions, which includes the following health conditions: chest pain, fever, cough, nausea and vomiting, and abdominal pain.

Data Source: Arizona Department of Health Services.

Colorado Hospitalization Data for New Mexico Residents

Figure 21. Percent of Colorado Hospitalizations based on New Mexico Patient Residence, 2016

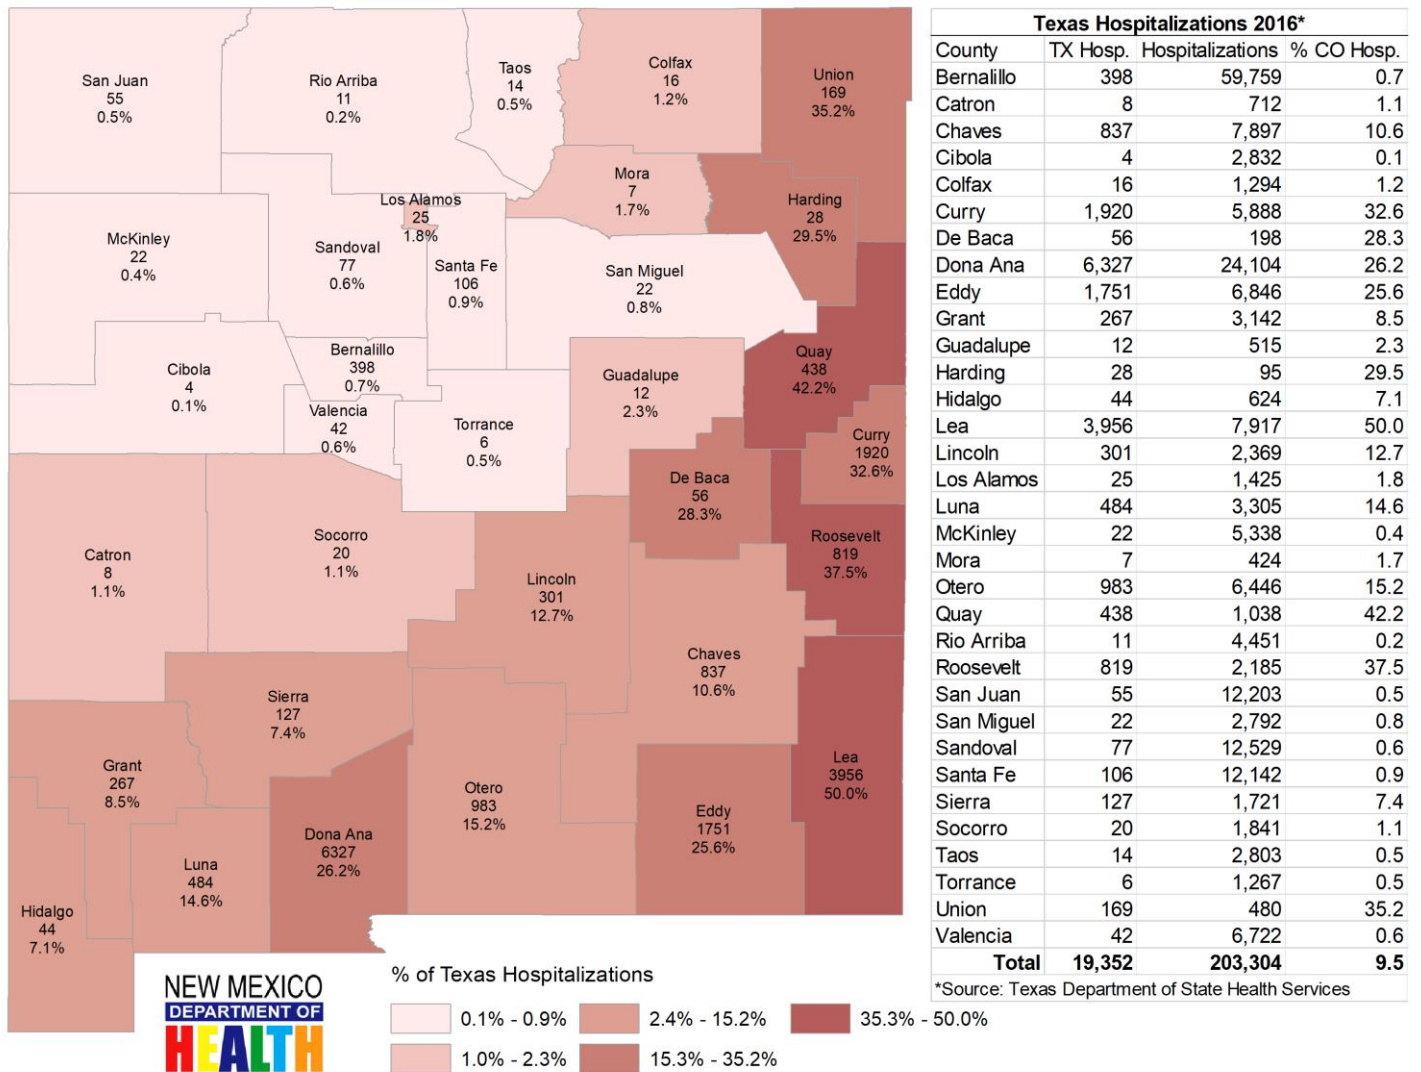

In 2016, Colorado hospitals provided services for 2,243 hospital discharges for New Mexico residents. Colorado hospital discharges accounted for 1.1% of the total NM resident hospital data. Colorado hospitalization data accounted for 17.5% of all hospitalization data for Colfax County residents and 7.8% for residents of San Juan County. The top first listed major diagnostic category for these hospital discharges was Diseases of the Musculoskeletal System and Connective Tissue.

Data Source: Colorado, State Inpatient Databases (SID), Healthcare Cost and Utilization Project (HCUP), Agency for Health Care Research and Quality.

Texas Hospitalization Data for New Mexico Residents

Figure 22. Percent of Texas Hospitalizations based on New Mexico Patient Residence, 2016

In 2016 Texas hospitals provided services for 19,352 hospital discharges for New Mexico residents. Texas hospital discharges accounted for 9.5% of the total NM resident hospital data. Texas hospitalization data accounted for 50.0% of all hospitalization data for Lea County residents. A high percentage was also observed for residents of Quay and Roosevelt counties. The top first listed major diagnostic category for these hospital discharges was Diseases of the Circulatory System.

Data Source: Texas Department of State Health Services.

Hospitalization Data for New Mexico Residents

Figure 23. Hospitalization Rates based on New Mexico Patient Residence, 2016

In 2016, NM facilities and facilities in neighboring states provided services for 203,304 discharges for New Mexico residents. The top first listed major diagnostic categories (not including births or pregnancy) for all New Mexico resident hospital discharges was Diseases of the Circulatory System, Diseases of the Digestive System, and Mental Disorders. The age adjusted rate of hospitalizations for New Mexico residents in 2016 was 921.3 hospitalizations per 10,000 population.

Appendix: Diagnosis Category ICD-10-CM Codes

Diagnosis Category	ICD-10-CM Range
Certain infectious and parasitic diseases	A00 - B99
Neoplasms	C00 - D49
Diseases of the blood and blood-forming organs and certain disorders involving the immune mechanism	D50 - D89
Endocrine, nutritional and metabolic diseases	E00 - E89
Mental, behavioral and neurodevelopmental disorders	F01 - F99
Diseases of the nervous system	G00 - G99
Diseases of the eye and adnexa	H00 - H59
Diseases of the ear and mastoid process	H60 - H95
Diseases of the circulatory system	I00 - I99
Diseases of the respiratory system	J00 - J99
Diseases of the digestive system	K00 - K95
Diseases of the skin and subcutaneous tissue	L00 - L99
Diseases of the musculoskeletal system and connective tissue	M00 - M99
Diseases of the genitourinary system	N00 - N99
Pregnancy, childbirth and the puerperium	O00 - O9A
Certain conditions originating in the perinatal period	P00 - P96
Congenital malformations, deformations and chromosomal abnormalities	Q00 - Q99
Symptoms, signs and abnormal clinical and laboratory findings, not elsewhere classified	R00 - R99
Injury, poisoning and certain other consequences of external causes	S00 - T88
External causes of morbidity	V00 - Y99
Factors influencing health status and contact with health services	Z00 - Z99
