

FENTANYL CAN CAUSE OVERDOSE

Fentanyl is showing up in pills, heroin, and cocaine. Overdose due to fentanyl has increased dramatically but is preventable.

FENTANYL FACTS

WHAT IS FENTANYL?

Fentanyl is a powerful synthetic opioid/pain-relieving drug prescribed for the treatment of extreme pain. It is now found in many street drugs, including pills, heroin, and cocaine, and only a small amount can cause an overdose.

HOW DO I KNOW IF FENTANYL IS IN MY DRUG SUPPLY?

Fentanyl may taste and look different or produce a different feeling than heroin or other drugs. Sample a small amount when uncertain about new drug supplies.

Fentanyl test strips can help you check your supply for illicit fentanyl. Test strips can be purchased online.
